## Introduction

The information in this report summarizes solid waste management in Ohio during 2003. This report was compiled from Ohio EPA records and from the “Annual Operational Report” for 2003, as reported in April 2004 by owners and operators of licensed solid waste facilities and existing facilities with a license application under appeal. The data compiled in this report extend from January 1 through December 31, 2003. Highlights of the report comparing 2003 to 2001 include:

- o the amount of residential/commercial waste disposed in licensed solid waste landfills in Ohio increased by 5.4 percent, industrial waste disposed increased by 6 percent, while exempt waste disposed increased by 16.5 percent;
- o estimated municipal landfill capacity increased from 21 years to 25.1 years, due in a large part to the inclusion of two facilities that are permitted but not yet constructed (Apex Landfill in Jefferson County, and Harrison Landfill in Harrison County);
- o the number of registered yard waste composting facilities increased from 602 to 609; and
- o the amount of out-of-state waste received by solid waste facilities (landfills) in Ohio increased by 29% percent to 2,541,070 tons. This represents a 67 percent increase over the amount of waste imported into Ohio in 1999. Between 1999 and 2003, Ohio waste exports to neighboring states increased 6 percent.

## The Number of Solid Waste Facilities: Past and Current

### Disposal Facilities

Ohio’s first solid waste law was enacted in December, 1967. The first solid waste regulations were adopted in July, 1968. The regulations required that each solid waste facility obtain a license to operate. By 1971, approximately 360 landfills and incinerators had received a solid waste license to operate. In January 2003, there were 61 existing landfills and incinerators in Ohio. This represents a loss of 83 percent in the number of solid waste disposal facilities in Ohio between 1971 and 2003 (see Figure 1). Note that this figure includes only currently-licensed facilities and existing facilities with a license application under

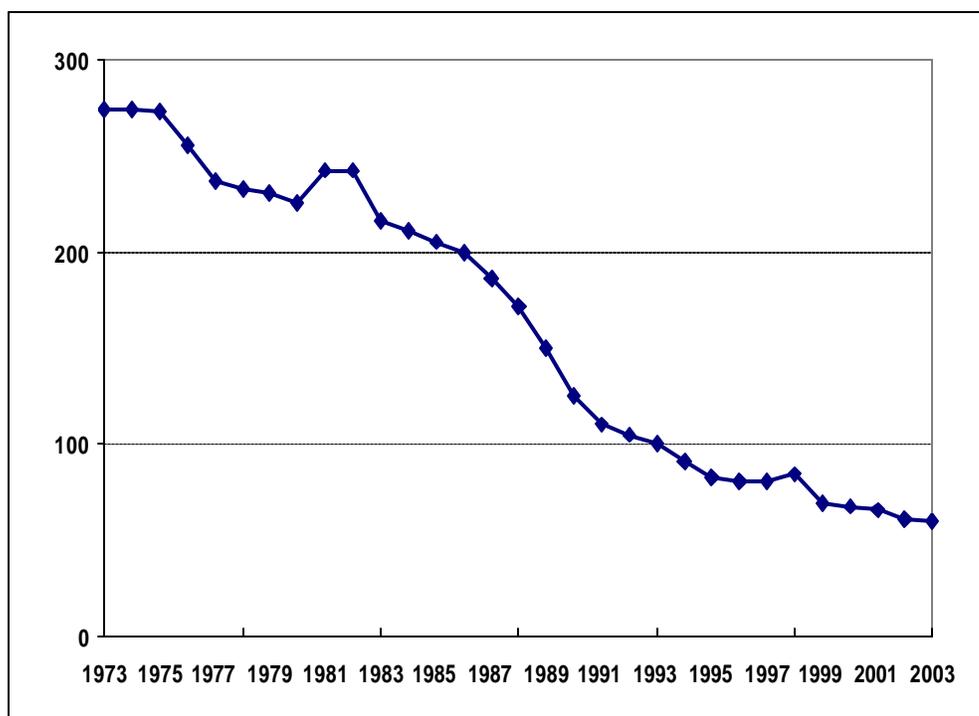

Figure 1. Number of Licensed Disposal Facilities

appeal. The figure does not include transfer facilities or compost facilities. It also does not include Pike Tire Monocell, American Tire Monofill, Liberty Tire Services of Ohio LLC (f.k.a. C&E Coal Pilot Waste Tire Project), or Envirosafe Services Hazardous Waste and Industrial Landfill.

(The location of each licensed, publicly-available solid waste landfill in Ohio is shown in Figure 17 on page 28. The names of these facilities are shown in Table 5 on page 29. The locations of transfer facilities are shown in Figure 18 on page 30 while their names are shown in Table 6 on pages 31 and 32.)

The existing facilities as of January 2003 can be broken down into the following categories: 42 publicly-available solid waste landfills (both public and private ownership), and 18 captive industrial waste landfills (See Table 1). At the beginning of 2003, the publicly-available landfills included 14 facilities owned by a local governmental entity, and 28 facilities that were privately-held. As reported by the owners and/or operators, three captive industrial landfills (Aluminum Smelting in Ashtabula County, Fraser Paper in Montgomery County and US Gypsum in Ottawa County) initiated closure activities in 2003. This resulted in 57 landfill sites by the end of 2003 with full operational status. The types of wastes disposed at both publicly-available and captive industrial landfills are discussed in more details on pages 11-13.

The only incinerator operating in Ohio is privately owned by BFI and is located in Trumbull County. This publicly-available facility primarily burns infectious waste, but is also licensed to burn a small amount of solid waste including medical records and off-specification pharmaceuticals.

### Transfer Stations

Beginning in 1989, Ohio EPA required existing and new transfer stations to obtain an annual operating license. As of June 1991, all new transfer stations and those undergoing modifications were required to obtain both a solid waste license and a permit-to-install. At the end of 2003, Ohio had 58 operating, licensed transfer stations.

### Composts

In 2003, Ohio EPA revised the regulatory structure for composting facilities as follows:

Category	Types of Waste Allowed to Compost	Facility Size Restriction
Class I	Mixed solid waste	none
Class II	Source-separated yard wastes, agricultural plant wastes, animal wastes, food wastes, and alternative materials approved by Ohio EPA	none
Class III	Source-separated yard wastes, agricultural plant wastes and animal wastes	less than 135,000 square feet
Class IV	Source-separated yard wastes	none

Class I facilities are required to obtain a permit and a license, Class II facilities are required to register and obtain a license, Classes III and IV are required to register with Ohio EPA. At the end of 2003, Ohio had 13 licensed Class II composting facilities. These facilities are authorized to accept yard waste, agricultural plant wastes, animal wastes, food wastes, and approved alternative materials (feedstocks, bulking agents and additives). Unlike Class III and IV facilities, Class II facilities may submit a request to accept alternative materials for incorporation into the composting process. Alternative material approvals granted to specific Class II facilities in 2003 include authorization to accept raw rendering material, and alum sludge.

Ohio's only Class I facility is located in Medina County and has been in operation since March 1997. This facility is permitted to compost the trommel screen fines from the operation of a material recovery facility. Current composting rules only permit the finished compost to be disposed into a licensed sanitary landfill. However, the facility has been

<p><sup>1</sup> Solid waste facility can be defined as follows:  “Public” or “publicly-available” facilities (owned either privately or publicly) are open to the public and accept residential, commercial and/or industrial waste (does not include 2 tire monofills, 1 tire monocell or Envirosafe Services HW &amp; Industrial Landfill).  “Captive Facilities are not open to the public, may accept only waste generated from the owner of an industrial company who also owns the disposal facility being used.  “Incinerators: w/energy recovery” generate electricity and/or steam heat in conjunction with burning solid waste.  “Incinerators: w/o energy recovery” burns solid waste without recovery of any energy.</p> <p><sup>2</sup> Some incinerators, designed primarily for processing infectious waste, are also licensed as solid waste facilities in order to burn incidental amounts of solid waste.</p> <p><sup>3</sup> It is not known how many of the registered Class III and Class IV compost facilities are operating since they are not required to report annually to the Ohio EPA. Therefore the numbers shown here represent the number of registered facilities.</p>					

authorized to use the finished compost as daily cover and as alternative intermediate cover at a landfill. The location of Class I & II composts are shown in Figure 19 on page 33. Ohio also had 60 registered Class III facilities and 540 registered Class IV facilities as of December 31, 2003. (It is not known how many of the registered Class III and Class IV facilities are actually operating.) While the Class III sites are authorized to compost yard wastes, agricultural plant wastes and animal wastes (e.g. manure), Class IV facilities may compost only yard waste. The solid waste management districts (SWMDs) having the largest number of registered Class IV composting sites are Cuyahoga County (35 facilities), Geauga County (37 facilities), and Hamilton County (26 facilities).

## Amounts of Solid Waste Managed in Ohio

Solid waste management among Ohio facilities includes recycling, transfer, composting, incineration, and landfilling. (See Figure 2. Substantial amounts of yard wastes are managed through composting. However, statewide estimates

of the amount of yard waste composted are not available, and therefore, composting is not included in Figure 2.) Recycling data is also not shown in Figure 2 because this information is reported in another Ohio EPA publication, Summary of Solid Waste Management in Ohio: Recycling, Reduction, Incineration, and Disposal. Wastes delivered to transfer facilities or incinerators are shown as separate management methods, yet at least some of these amounts are also included in the landfilled category.

Landfilling was the primary management method for solid waste in Ohio in 2003. Figure 3 shows the total amount of solid waste disposed in Ohio during 2003. Solid waste landfill operators reported disposing 20,965,920 tons in 2003, which includes 4.9 tons of ash from solid waste incinerators. Subtracting the ash generated at these incinerators, and then adding the 8.4 tons of waste delivered to the solid waste incinerators results in a net total of 20,965,923 tons of solid waste delivered to landfills and incinerators in Ohio in 2003. The following sections provide more detail on waste management methods utilized across Ohio.

### Amounts of Waste Landfilled

In 2003, solid waste landfill operators reported receiving 20,965,920 tons, which is 1,271,743 tons above 2001 levels, an overall increase of 6.5 percent. Roughly 11 percent of this increase is attributable to an increase in disposal at Ohio's captive industrial landfills. Forty-four and one-half percent of the increase is due to an increase in out-of-state waste receipts, and the remaining 44.5 percent is due to an increase in disposal of Ohio's generated waste at Ohio's publicly-available landfills.

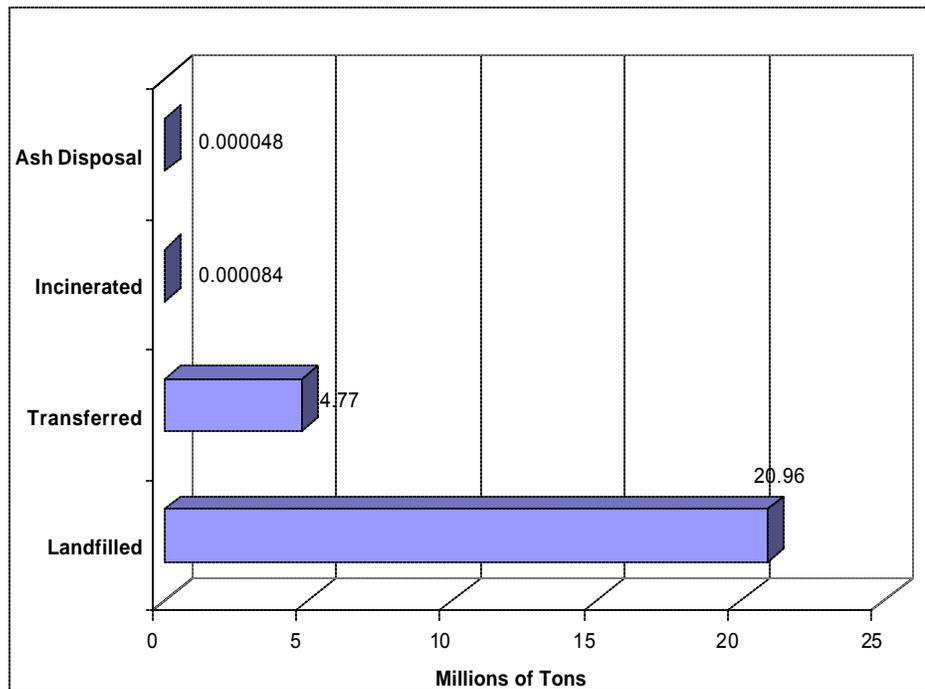

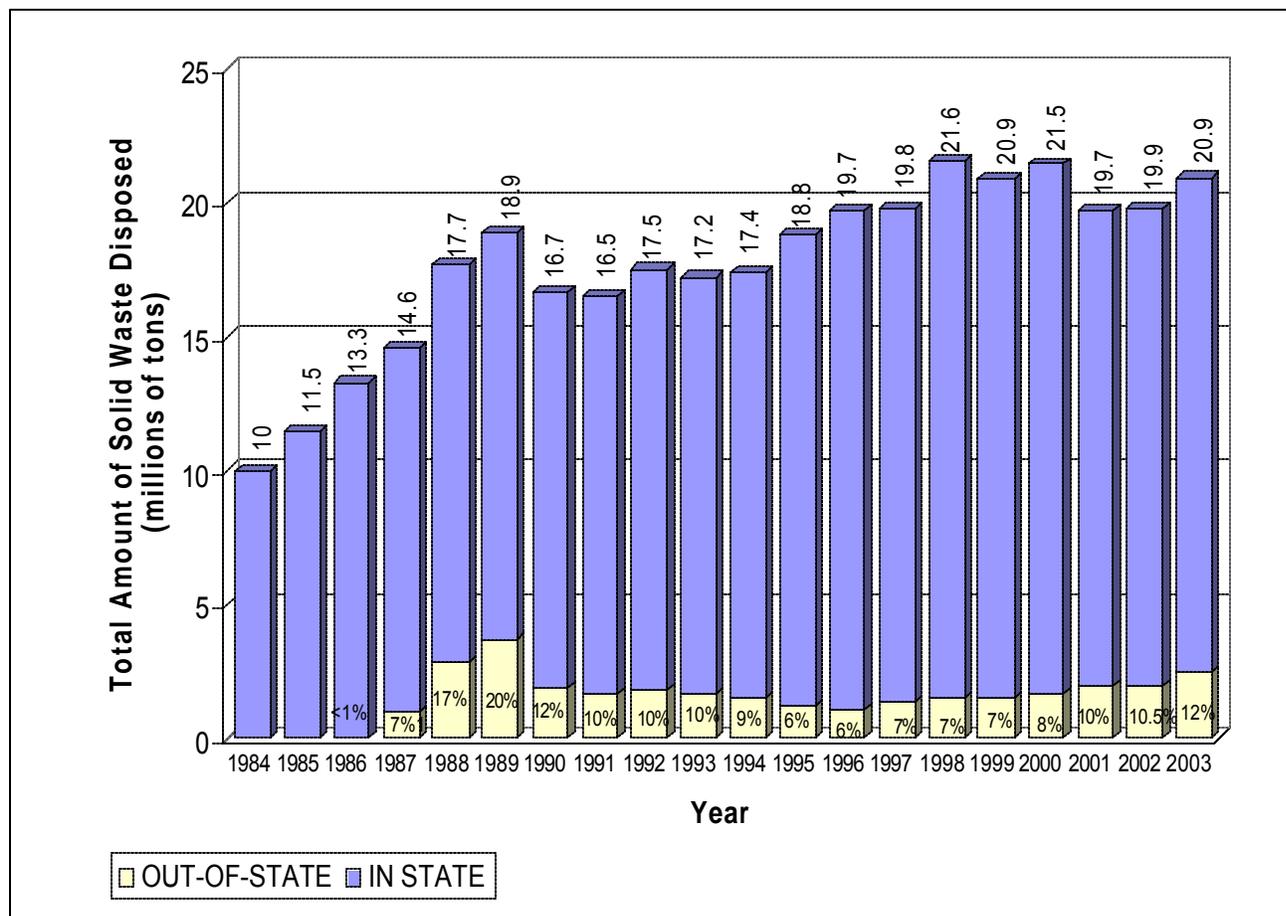

Figure 2. Management Methods for Solid Waste in 2003

Ohio's captive industrial landfills disposed of 4,990,369 tons in 2003. Roughly 85 percent of this was waste disposed at three Ohio captive facilities that dispose of waste from coal-fired plants. These facilities include the Zimmer Industrial Landfills (Clermont County), the Gavin Residual Waste Landfill (Gallia County), and the CSP Conesville Residual Landfill (Coshocton County). For more than five years in a row disposal at these facilities has equaled approximately 20 percent of total landfill disposal and in 2003, the amount disposed at these three sites totaled more than 85 percent of all waste disposal at captive facilities in Ohio (See Figure 6 on page 8). Since 1999, disposal at publicly-available landfills has increased by 9.85 percent. Table 7 shows the total amount of waste disposed by each landfill in Ohio during 2003, by its source of generation: in-district, out-of-district, and out-of-state. See Table 8 for a comparison of the 2001, 2002 and 2003 amounts disposed by each Ohio landfill.

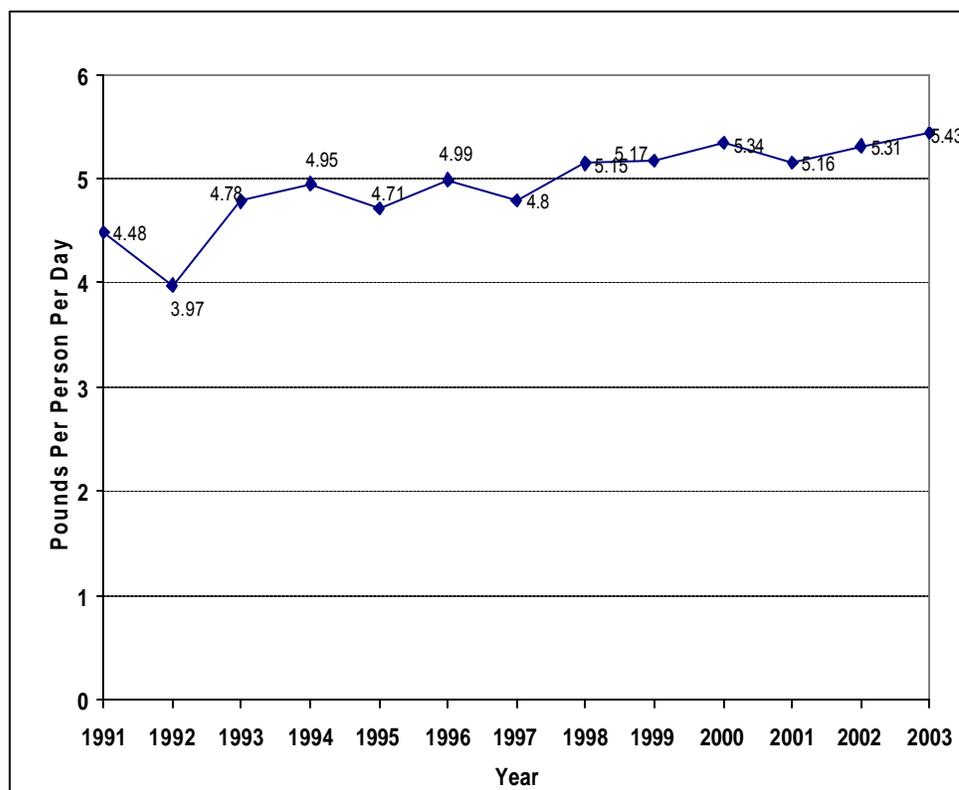

Ohio's population was estimated to be 11,451,851 in 2003 (As reported by Ohio's solid waste management districts to Ohio EPA.). Using this information, the disposal facilities in Ohio received an estimated 1.82 tons per person in 2003. If wastes imported into Ohio are excluded and Ohio-generated waste exports to neighboring states are included, the disposal rate for Ohio-generated waste is approximately 1.71 tons per person. See pages 21-25 for more information regarding out-of-state wastes.

In *Municipal Solid Waste in the United States: 2001 Facts and Figures* (U.S. EPA, October 2003), the U.S. EPA has estimated the national average municipal solid waste generation rate for 2001 at 4.4 pounds per person per day (pppd). This publication also estimated the national average disposal rate of 3.1 pppd. Using the total amount of residential and

**Figure 3.** Tons of Solid Waste Received at Ohio Landfills and Incinerators 1984-2003

commercial waste (or general solid waste) disposed in Ohio along with Ohio waste exported to neighboring states (excluding waste imported into Ohio) and dividing by Ohio's population results in a disposal rate of 0.99 tons per person per year, or 5.43 pppd. (This calculation includes asbestos, general solid waste, and other solid waste as characterized by the landfill operator.) This residential/commercial disposal rate for 2003 compares to 5.34, 5.17, and 5.15 pppd for 2000, 1999, and 1998, respectively (see Figure 4). It is important to note that the calculations shown in Figure 4 are not as accurate for the years between 1991 and 1994 because Ohio residential/commercial disposal exports were not added to this calculation until 1995.)

**Figure 4.** Ohio's Residential/Commercial Solid Waste Disposal Rate 1991-2003

It is unlikely that the residential/commercial disposal rate actually differed from the national average as much as the estimates for Ohio suggest. Ohio EPA believes that at least part of the difference may be a result of mixed loads of waste (residential/commercial waste mixed with industrial waste) arriving at landfill gates that are being mischaracterized as residential/commercial waste only, thus inflating the residential/commercial disposal rate.

#### Amounts of Waste Incinerated

In Ohio, incineration essentially ceased being a municipal solid waste management option in 1997 due to the closure of large, publicly-owned incinerators. Municipal Waste incineration peaked in 1992 when 1,349,000 tons of waste (8% of the waste stream) was incinerated. At the present time all municipal solid waste incinerators and waste-to-energy incinerators in Ohio have closed or ceased operations. Certain "non-hazardous" wastes such as waste oil continue to be burned for energy recovery; however, this does not fall under the traditional definition of solid waste incineration. This waste was incinerated at the BFI Medical Waste System (Warren) Incinerator, the only licensed publicly-available incinerator in Ohio. The amount of solid waste incinerated in Ohio has steadily declined from the high of 1,349,000 tons in 1992 to a low of 34.1 tons in 2001 (See Figure 5).

#### Amounts of Waste Transferred

A total of 58 licensed transfer facilities received an estimated total of 4,424,917 tons in 2003 (See Table 10). Of the 4,424,917 tons of waste received by transfer facilities, 819,267 tons originated from outside the solid waste district where the transfer facility is located. The number of tons transferred that originated outside the solid waste district in which the transfer station was located was 552,273 tons in 1999, 680,154 tons in 1998 and 520,824 tons in 1997.

### Amounts of Waste Recycled/Reduced

An inventory for solid waste management activities has been developed through the preparation of solid waste management district (SWMD) plans, and annual monitoring of plan implementation. These plans and annual reports are required to identify all existing solid waste recycling activities and determine the amounts and types of materials being recycled.

Based upon Ohio EPA's analysis of SWMD annual reports for the 2003 calendar year, a total of 12,904,392 tons of solid waste recycled (down from 13,540,825 tons in 2001). This represented approximately 40 percent (up from 32 percent in 1995) of the total amount of waste generation (defined as disposal plus recycling) for 2003. And there were approximately 479 curbside (both non-subscription and subscription) and 992 drop-off recycling programs (up from 880 in 2001) operating in Ohio in 2003. Many of these programs are supported by the Ohio Department of Natural Resources (ODNR) annual "Recycle, Ohio!" grant program. In 2003, \$6,970,081 in "Recycle, Ohio!" grants were awarded to 99 Ohio cities, county governments and regional solid waste management districts. For more information on waste reduction and recycling in Ohio, please see the Ohio Environmental Protection Agency's report titled Summary of Solid Waste Management in Ohio: Reduction, Recycling, Disposal and Incineration. For more information on ODNR's "Recycle, Ohio!" grant programs please see <http://www.ohiodnr.com/recycling/grants/rog/2003/reports/>.

### General Trends: 1984 through 2003

During the past decade, solid waste management has changed considerably. The general trend within the State shows a significant increase in the amount of solid waste disposed from 1984 through 1989 (See Figure 3 on page 5), and then stabilizing at 16.5 to 17.5 million tons per year between years 1990 and 1994. Beginning in 1995 disposal began to increase again until reaching a peak of 21.6 million tons in 1998. Since that year, waste receipts have stayed within the range of 19.7 to 21.6 million tons.

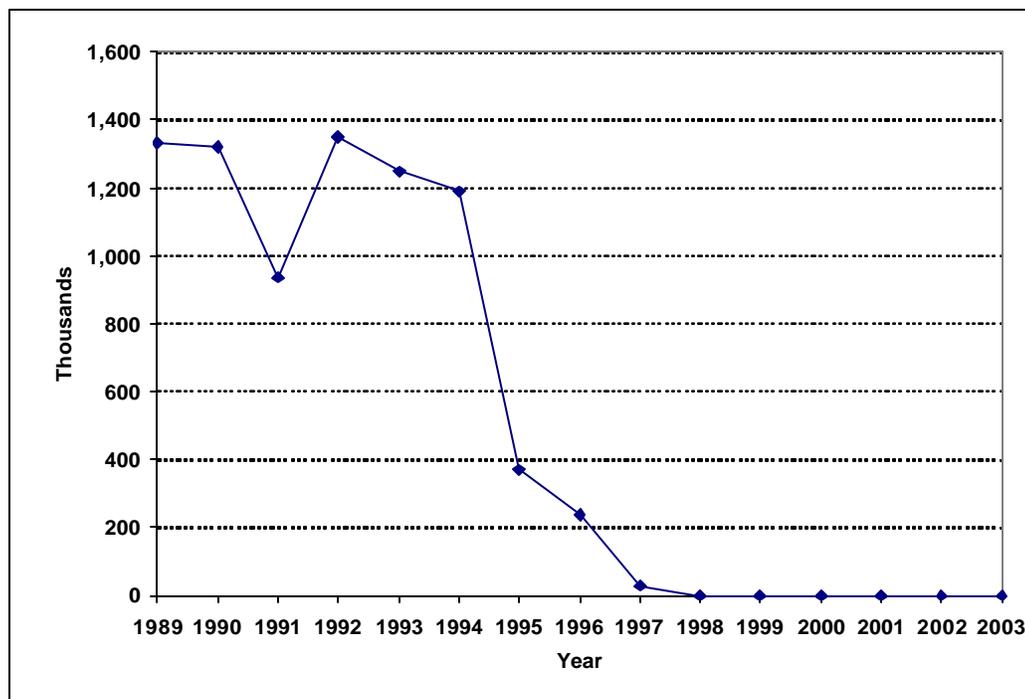

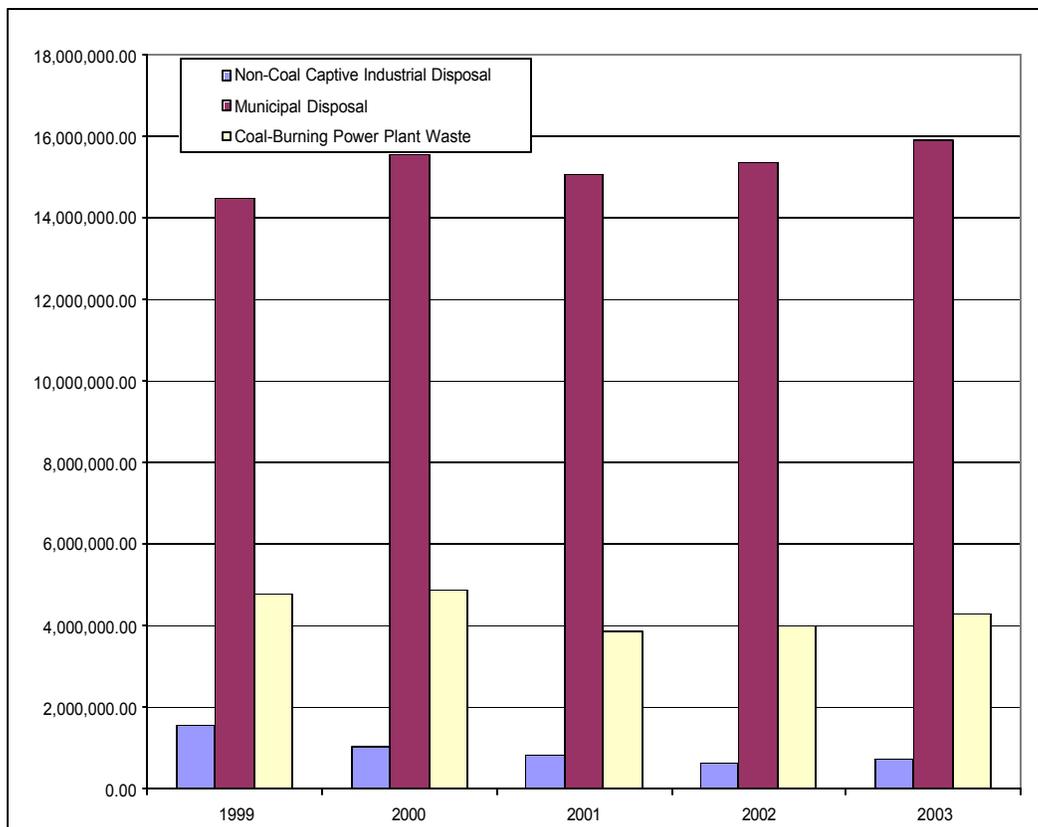

Figure 5. Tons of Solid Waste Incinerated: 1989-2003

In 1990, the steep rise in the amount of solid waste annually disposed in Ohio ended, decreasing by more than 17 percent compared to 1989. In 1991, the trend in amounts disposed continued to be lower than the record high waste receipts reported by facilities in 1989. In 1992, the amount disposed in Ohio increased by almost a million tons compared to the previous year. The 1994 disposal amount was very similar to 1992 and 1993 amounts. (See Figure 3.) A small percentage of the total decrease in the 1990 through 1994 disposal amounts compared to 1989 was due to the exclusion of incinerator ash to avoid double-counting. For years prior to 1990, both the solid waste received and the ash generated by solid waste incinerators and resource recovery facilities have been included in the totals.

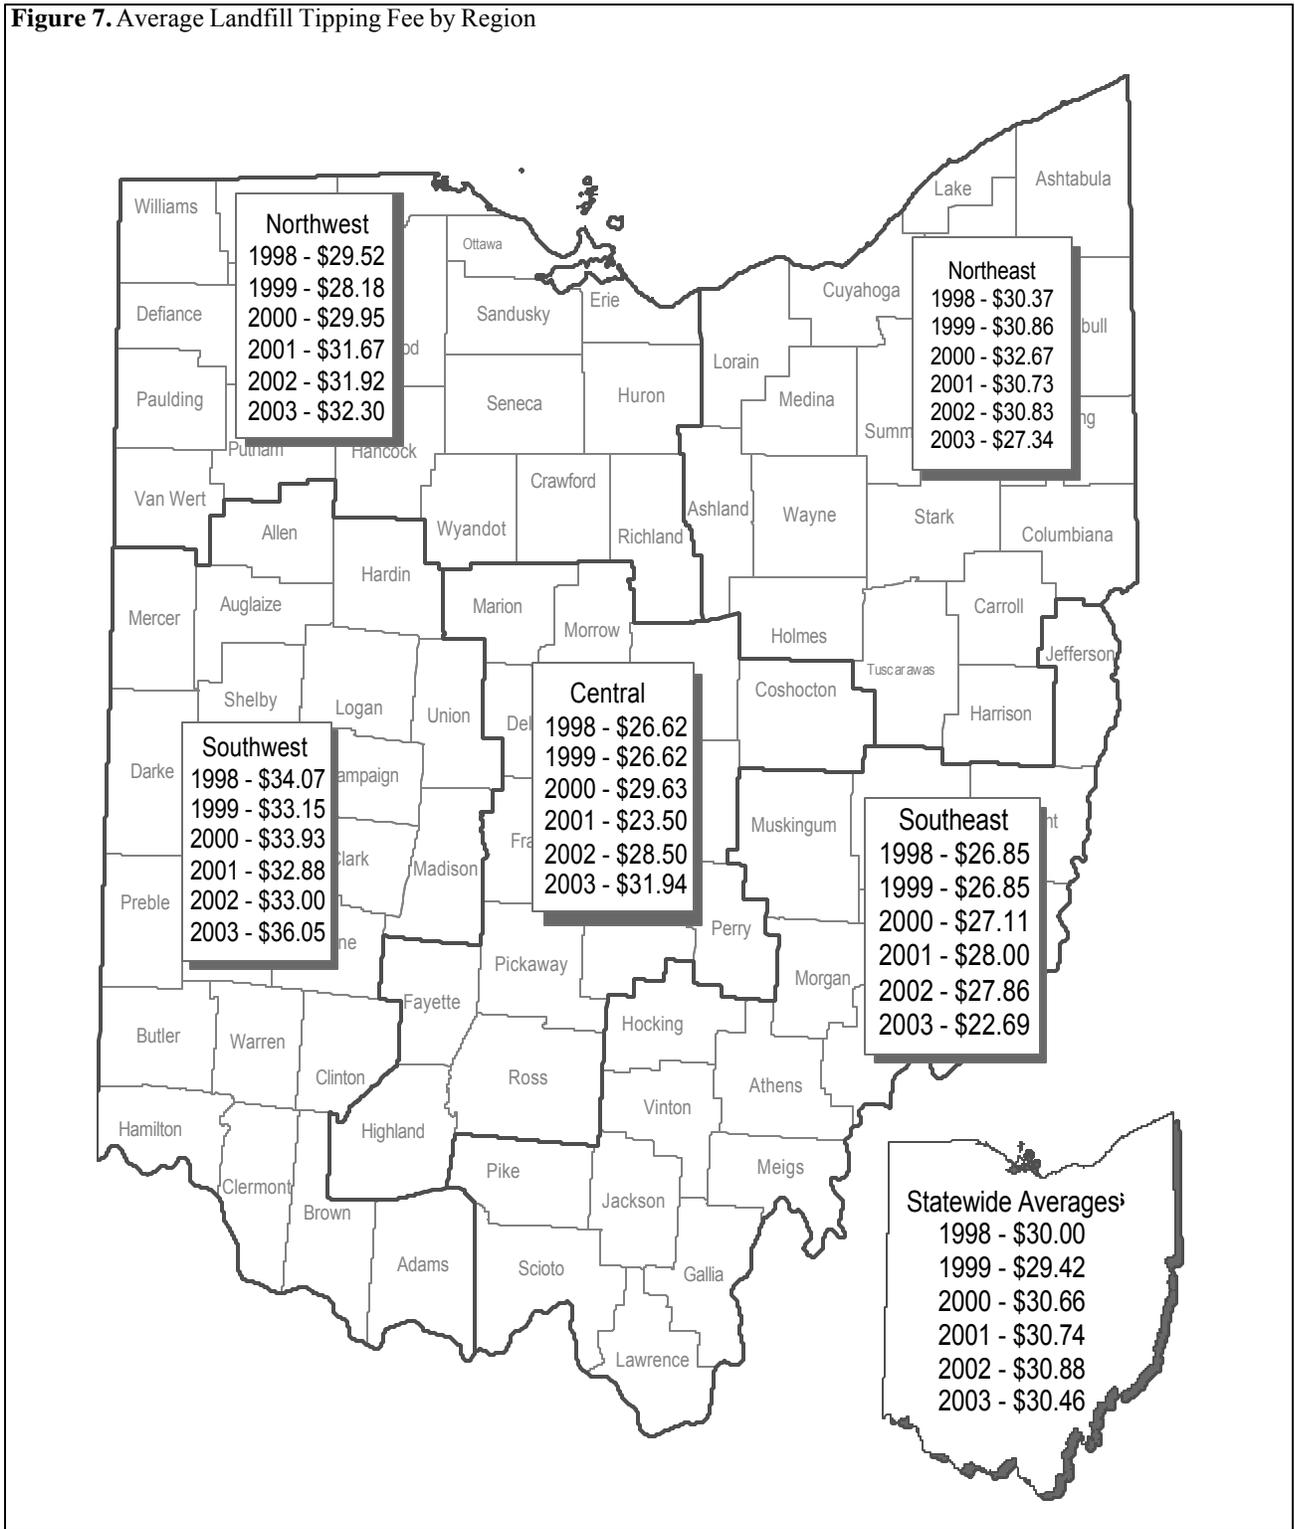

The amount of waste disposed in 1995 increased by 5 percent, to 18.8 million tons. The amount of in-state generated waste disposed in Ohio increased by 2.2 millions tons. Most of this increase was attributed to one captive industrial landfill that began operation in 1995. The amount of residential/commercial waste disposed in 1995 actually decreased almost 800,000 tons.

**Figure 6.** Coal-burning power plant waste disposed 1999 - 2003

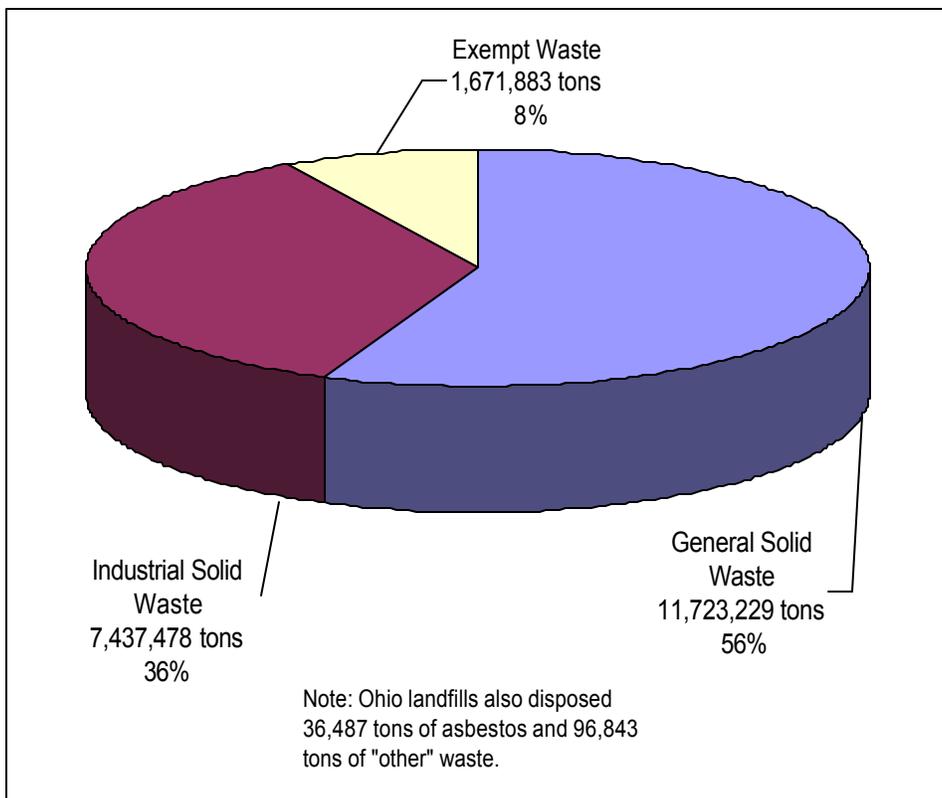

The amount of waste disposed in Ohio continued to increase from 1996 through 1998. Increases in both out-of-state waste disposal and in-state generated waste disposal occurred in 1998. Figure 3 shows that the total out-of-state waste disposed has remained roughly 7 percent of the total disposal between 1997 and 1999. Up until 2000 out-of-state waste amounts were increasing at a rate proportional to in-state generated waste disposal. By 2001, however, out-of-state imports jumped to approximately 10 percent of all waste disposed in Ohio, due to a 1,632,996 decrease (8.4 percent) in in-

**Figure 7. Average Landfill Tipping Fee by Region**

state disposal and a 454,276 tons increase (29.1 percent) in out-of-state imports between 1999 and 2001. In 2001, the decrease in the in-state generated waste disposal was largely be attributed to the reduction of disposal in captive facilities. Figure 3 shows that the total out-of-state waste disposed has remained roughly 7 percent of the total disposal between 1997 and 1999. Up until 2000 out-of-state waste amounts were increasing at a rate proportional to in-state generated waste disposal. By 2001, however, out-of-state imports jumped to approximately 10 percent of all waste disposed in Ohio, due to a 1,632,996 decrease (8.4 percent) in in-state disposal and a 454,276 tons increase (29.1 percent) in out-of-state imports between 1999 and 2001. As discussed previously, the decrease in the in-state generated waste disposal can largely be attributed to the reduction of disposal in captive facilities from 1999 to 2001. Disposal in captive facilities decreased by 26 percent while disposal in publicly-available facilities increased by nearly 4 percent between 1999 and 2001. In 2003, there were increases across the board. In-state municipal, in-state captive disposal (including waste from coal-fired power plants) all increased.

Factors affecting changes in amount of waste disposed are difficult to quantify, but probably include such things as the

**Figure 8.**Types of Waste Disposed in Ohio Landfills and Incinerators in 2003

cost of disposal in Ohio. (See Figure 7 for average landfill tipping fees.) In 2003, tipping fees increased in the southwest, northwest and central regions and decreased in the north and southeast regions. The most notable changes include a nearly five dollar per ton decrease in the southeast and a nearly three dollar per ton increase in the southwest. It should be noted that the tipping fees reported are the publicly posted fees. Some municipalities and SWMDs contract with Ohio landfills for disposal at significantly lower tipping fees than those reported to Ohio EPA in the facilities' annual reports.

The installation of scales at several large landfills may be another factor leading

to different in-state disposal estimates for 1991 through 2001 versus 1990. Prior to the use of scales, many facilities used visual estimates of the volume of waste brought to the facility and calculated the tonnage by using a conversion factor. As stated earlier, another very important factor affecting the amount of waste disposed is related to economic growth. A more vigorous economy generally produces more waste, as suggested by Ohio's 2001-2003 residential/commercial waste disposal rates as shown in Figure 4. In addition, U.S. EPA projects a slow but steady increase in the generation of municipal solid waste through the end of the century (Municipal Solid Waste in the United States: 1999 Facts and

Figures), which puts more pressure on disposal. Changes in population should also affect the disposal rate, but the data for Ohio over the past few years do not show a close correlation between changes in population and variations in waste disposed.

### Types of Wastes Received for Disposal

As solid waste is received, landfill, incinerator, and transfer facility operators are required to record the types of waste in each load. Table 7.1 shows the total waste disposed in Ohio landfills by type as reported by the operator. Waste is classified in one of the following categories:

- asbestos waste
- general solid waste
- industrial solid waste
- exempt waste
- other waste

Asbestos is a special waste stream that is not accepted at most of the landfills in Ohio. Landfills are required to obtain a special air permit from Ohio EPA in order to dispose of asbestos. In 2001, twelve publicly-available Ohio landfills accepted asbestos for disposal.

General solid waste usually consists of residential and commercial garbage. General solid waste does not include industrial solid waste, but does include materials which independently, are not solid wastes until they were physically mixed with solid waste at the generating source. All of the 11,723,228 tons of general solid waste received by Ohio landfills in 2003 was disposed in publicly-available facilities which are classified as municipal solid waste landfills, or scrap tire monofills/monocells for purposes of Ohio solid waste regulations. The definition of general solid waste includes scrap tires and petroleum contaminated soil. Examples of specific general solid waste streams include:

- household garbage
- household hazardous wastes
- scrap tires
- contaminated soil (resulting from underground storage tank removal)
- municipal solid waste incinerator ash
- municipal waste water treatment sludge (dewatered)

During 2003, there were two scrap tire monofills and one scrap tire monocell operating in Ohio and disposing of only a single, homogeneous type of waste in the general solid waste category—scrap tires. American Tire Monofill and Liberty Tire Services of Ohio LLC are the two scrap tire monofills (Stark County) and Pike Sanitation Scrap Tire Monocell (Pike County) is the only tire monocell operating in Ohio.

Industrial solid waste includes any non-hazardous solid waste which results from, or is the residue of, an industrial process. Approximately 62 percent of the industrial waste disposed in Ohio in 2003 was disposed in captive industrial

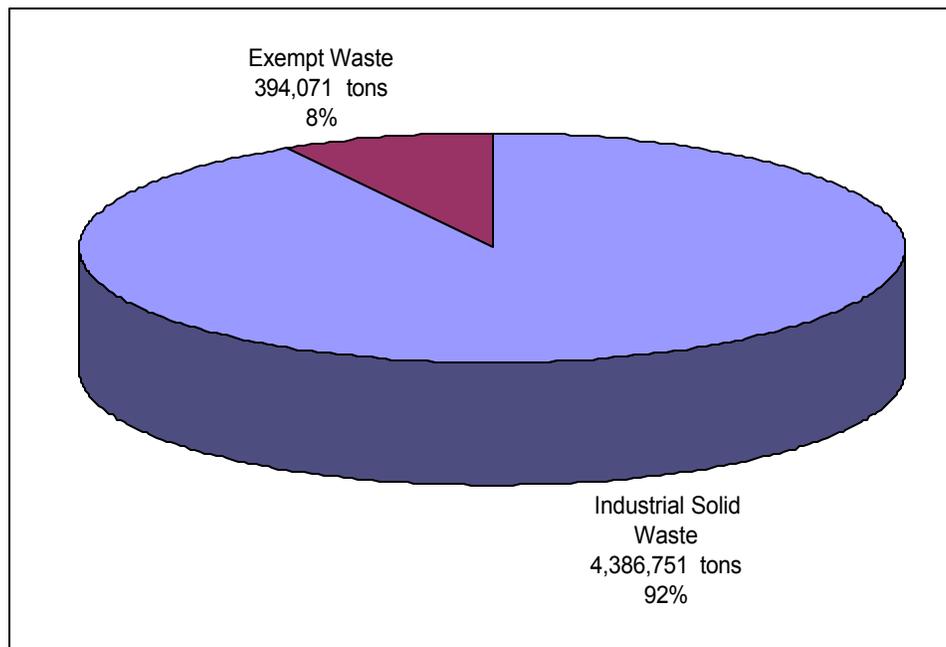

Figure 9. Types of Waste Disposed in Ohio Captive Landfills in 2003

landfills (down from 72 percent in 1999). Captive industrial landfills are licensed as either “industrial solid waste landfills” or “residual waste landfills.” An industrial solid waste landfill must be constructed and sited according to requirements which are slightly less restrictive than those for municipal solid waste landfills, and which disposes only one or more types of industrial waste, with very minor amounts of municipal solid waste<sup>2</sup>.

Residual waste landfills may dispose of waste generated only from seven specific industrial processes and are prohibited from disposing municipal solid waste.<sup>3</sup> Residual waste landfills are defined as Class I, Class II, Class III, or Class IV depending upon the characterization of the waste the facility is authorized to dispose. Waste destined for a Class IV facility must show lower concentrations of specified chemical constituents than residual waste disposed in a Class I, II, or III facility, and may comply with less restrictive regulations. Likewise, the design criteria for a Class III residual waste facility are less restrictive than a Class I or II.

By the end of 2003, Ohio had 12 licensed residual waste landfills, including three Class I, zero Class II, eight Class III and 1 Class IV landfills. The remaining captive industrial landfills were licensed as industrial solid waste landfills. The following list shows examples of industrial solid waste and residual solid waste:

- fly ash
- control dust
- bottom ash
- adhesives
- carbon black
- clay
- concrete and brick
- air pollution
- paint filters
- aluminum dross
- lime
- foundry sand
- empty containers
- metal shavings
- rubber
- oil filters
- waste water treatment filter cake
- silica gel

Industrial waste, as defined above, is also accepted at one publicly-available hazardous waste landfill, EnviroSAFE Services HW and Industrial Landfill in Lucas County. This landfill reported accepting 1,513 tons of industrial solid waste in 2003 (the facility also disposed of 747 tons of other waste). This facility is not by definition a captive industrial landfill nor a municipal solid waste landfill. However, since industrial solid waste is disposed at this facility, the disposal totals are included in this report.

Exempt waste refers to materials that are excluded from the statutory definition of solid waste, but may legally be disposed in a solid waste disposal facility. Examples of waste streams included in this category are:

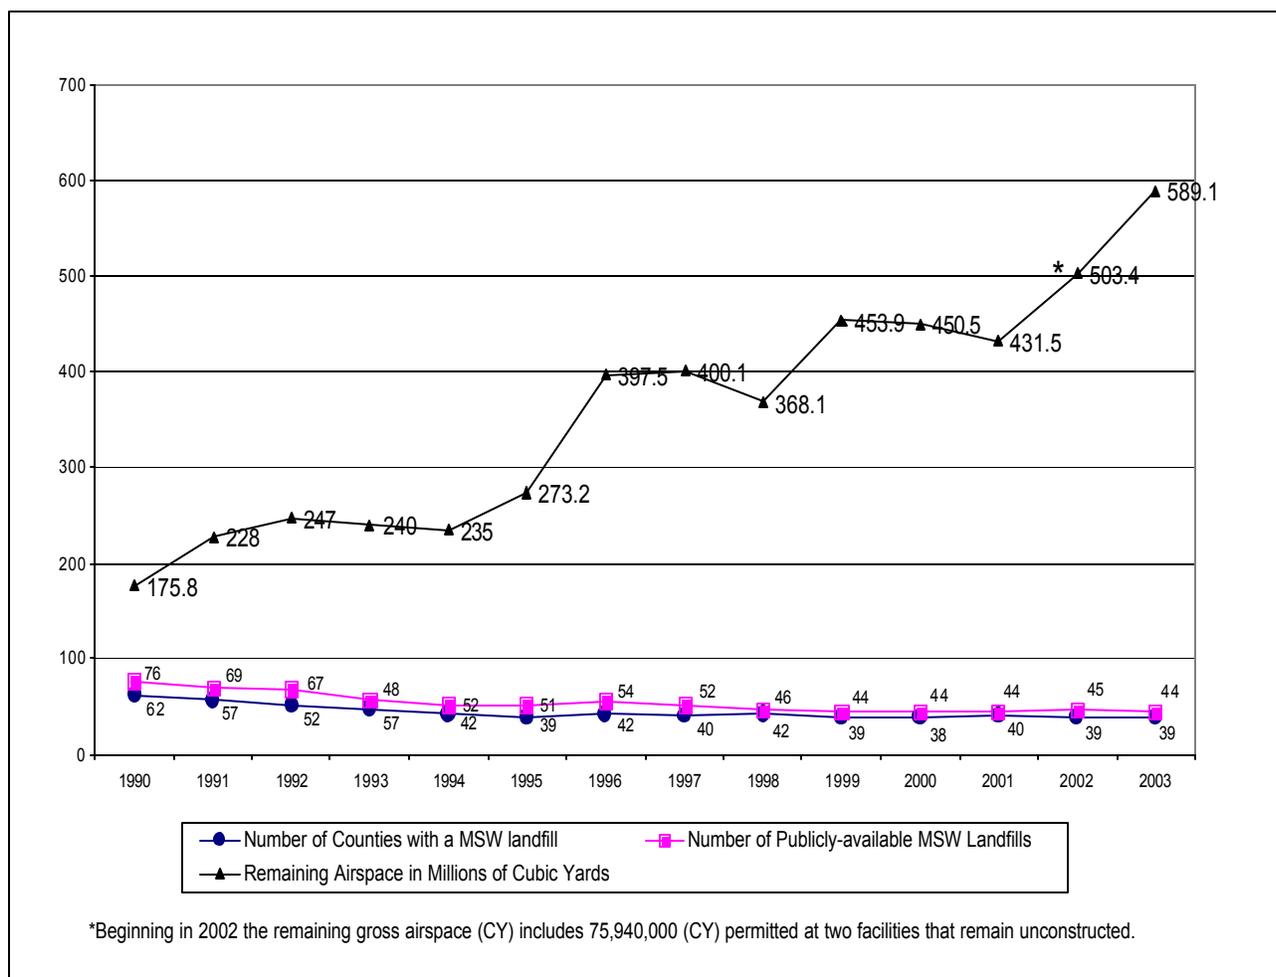

- slag
- nontoxic fly ash
- spent nontoxic foundry sand
- material from mining
- construction and demolition debris
- cinders

Construction and demolition debris (C&DD) is exempt from solid waste regulations, however, C&DD disposal facilities are regulated under Chapter 3745-400 of the Ohio Administrative Code. Existing construction and demolition debris landfills are required to submit a license application by September 30 each year.

Other waste is defined as that category of solid waste which includes waste not listed in the above categories, such as mixtures of unknown composition. Examples of waste streams classified as other waste include:

- treated infectious waste (autoclaved or incinerated)
- off-specification pharmaceuticals
- outdated food and drug products

Figure 8 shows the tons of waste disposed in Ohio landfills by waste category. (Asbestos and other waste comprise less than one percent of the total waste disposed, and therefore, are not shown in Figure 8.) Figure 9 shows the amount of waste disposed in captive industrial landfills by waste type. The tonnages in each category should be treated as estimates only. It is clear from information provided to Ohio EPA that facility operators are not always able to identify the

**Figure 10.** Publicly-Available Landfills and Remaining Airspace

type of waste accurately, particularly when the hauler is servicing several accounts on the same route, or the waste has been processed through a transfer facility prior to delivery to the landfill.

Figure 8 illustrates that 56 percent of the waste disposed in public and captive landfills is categorized by the facility operators as GSW, up from 53 percent in 1999 (and 51 percent in 1998). Industrial waste makes up 36 percent of the total waste disposed. Exempt waste constitutes approximately eight percent of the waste stream sent to landfills and incinerators.

Figure 9 shows that 92 percent of the waste disposed by captive landfills is classified as industrial waste. The remaining waste disposed at captive sites is exempt waste.

**Table 2. Statewide Publicly-Available Landfill Capacity (As of December 31, 2003)**

	Remaining Volume Millions of Cubic Yards of Gross Airspace	Airspace Used Per Year Millions of Cubic Yards	Years of Capacity
Case 1:	589,149,395	21.2	27.8
Case 2:	589,149,395	17.5	33.6
Case 3:	589,149,395	17.9	32.9
Case 4:	589,149,395	23.9	24.6

**Scenarios:**

- Case 1: The remaining years of capacity is based on the amount of remaining capacity and airspace used, as reported by landfill operators for 2003. Landfill operators reported accepting approximately 15.9 million tons of waste and using 21.2 million cubic yards of landfill volume. This translates to a ratio of landfill volume used to weight received of 1.33 cubic yards to the ton.
- Case 2: Assumes that the improved compaction of waste and the reductions in the amount of cover materials used at landfills result in a decrease in the statewide volume use to weight of waste ratio from 1.33 to 1.1 cubic yards to the ton. Waste receipts are assumed to remain constant at 15.9 million tons.
- Case 3: Assumes that effects to reduce and recycle wastes result in a decline of waste receipts of 15 percent from current levels. Waste receipts at publicly available facilities would decline to 13.5 million tons and airspace used to 17.9 million cubic yards per year, at the ratio of 1.33 cubic yards to the ton.
- Case 4: Assumes that waste receipts at municipal solid waste landfills increases to 1989 levels of approximately 18.0 million tons of non-captive landfill disposed waste. Landfill volume-to-weight ratio remains at 1.33 cubic yards to the ton.

Note: In each of the scenarios it is assumed that no new capability is added. The remaining years' capacity figure is the number of years it would take to exhaust the remaining airspace, at the indicated rate of consumption. The remaining volume does not include captive landfills. Two permitted but un-constructed landfills have been included in the calculations. These two facilities are Apex Landfill in Jefferson County (17,940,000 cubic yards), and Harrison Landfill in Harrison County (58,000,000).

Sample calculation: 589,149,395 million cubic yards divided by 21,153,301 million cubic yards per year = 27.8 years.

## Landfill Disposal Capacity

### Statewide Disposal Capacity

For several years, the availability of disposal space has been shifting from small local landfills to larger regional landfills. This shift is indicated by the fact that the number of operating landfills has decreased while remaining airspace has

increased (See Figure 10). For example, in December of 1990, there were 76 municipal solid waste landfills in Ohio reporting a total remaining airspace of approximately 176 million cubic yards. By the end of 2003, there were only 44 municipal solid waste landfills (including Apex Landfill and Harrison Landfill which are permitted but not constructed), but they reported having 589.1 million cubic yards of remaining airspace (This is a 17 percent increase from 503.4 million cubic yards in 2002.). In addition, there were only 10 solid waste management districts without a landfill in 1990, whereas by the end of 2001, there were 22 solid waste management districts without an operating landfill. These changes are in large part a result of the technological upgrades to the siting/design requirements. These requirements were promulgated in Ohio EPA's 1990 rules enacted as a result of the passage of House Bill 592 in 1988. Ohio's landfill regulations were updated again in 1994 to remain consistent with federal regulations.

Beginning in 1982, Ohio EPA began collecting data on existing disposal capacity from operators of landfills in the state. Interestingly, from 1982 to 1990, the data showed a trend of decreasing disposal capacity in the state that coincided with the decline in the number of operating landfills. However, from 1990 to 2003, as stated previously, existing disposal capacity in the state increased by 145 percent while the number of operating landfills decreased by 42 percent (See Figure 10). It should be noted that four publicly-available facilities have not been included in these calculations since they accept only specialized solid wastes. These facilities are the Pike Sanitation Scrap Tire Monocell (Pike County), American Tire Monofill (Stark County), Liberty Tire Services of Ohio LLC (Stark County), and Enviro-safe Services Hazardous Waste and Industrial Landfill (Lucas County).

Existing disposal capacity is measured in cubic yards of airspace available for the placement of wastes, or gross airspace. Facility operators are required to report to Ohio EPA an estimate of the amount of permitted gross airspace remaining at

**Table 3. Remaining Capacity at Ten Publicly-Available Solid Waste Landfills with Highest Waste Receipts in 2003**

County	Facility Name	Total Tons Received	Remaining Capacity Gross Airspace Remaining (cu. yds.)	Years

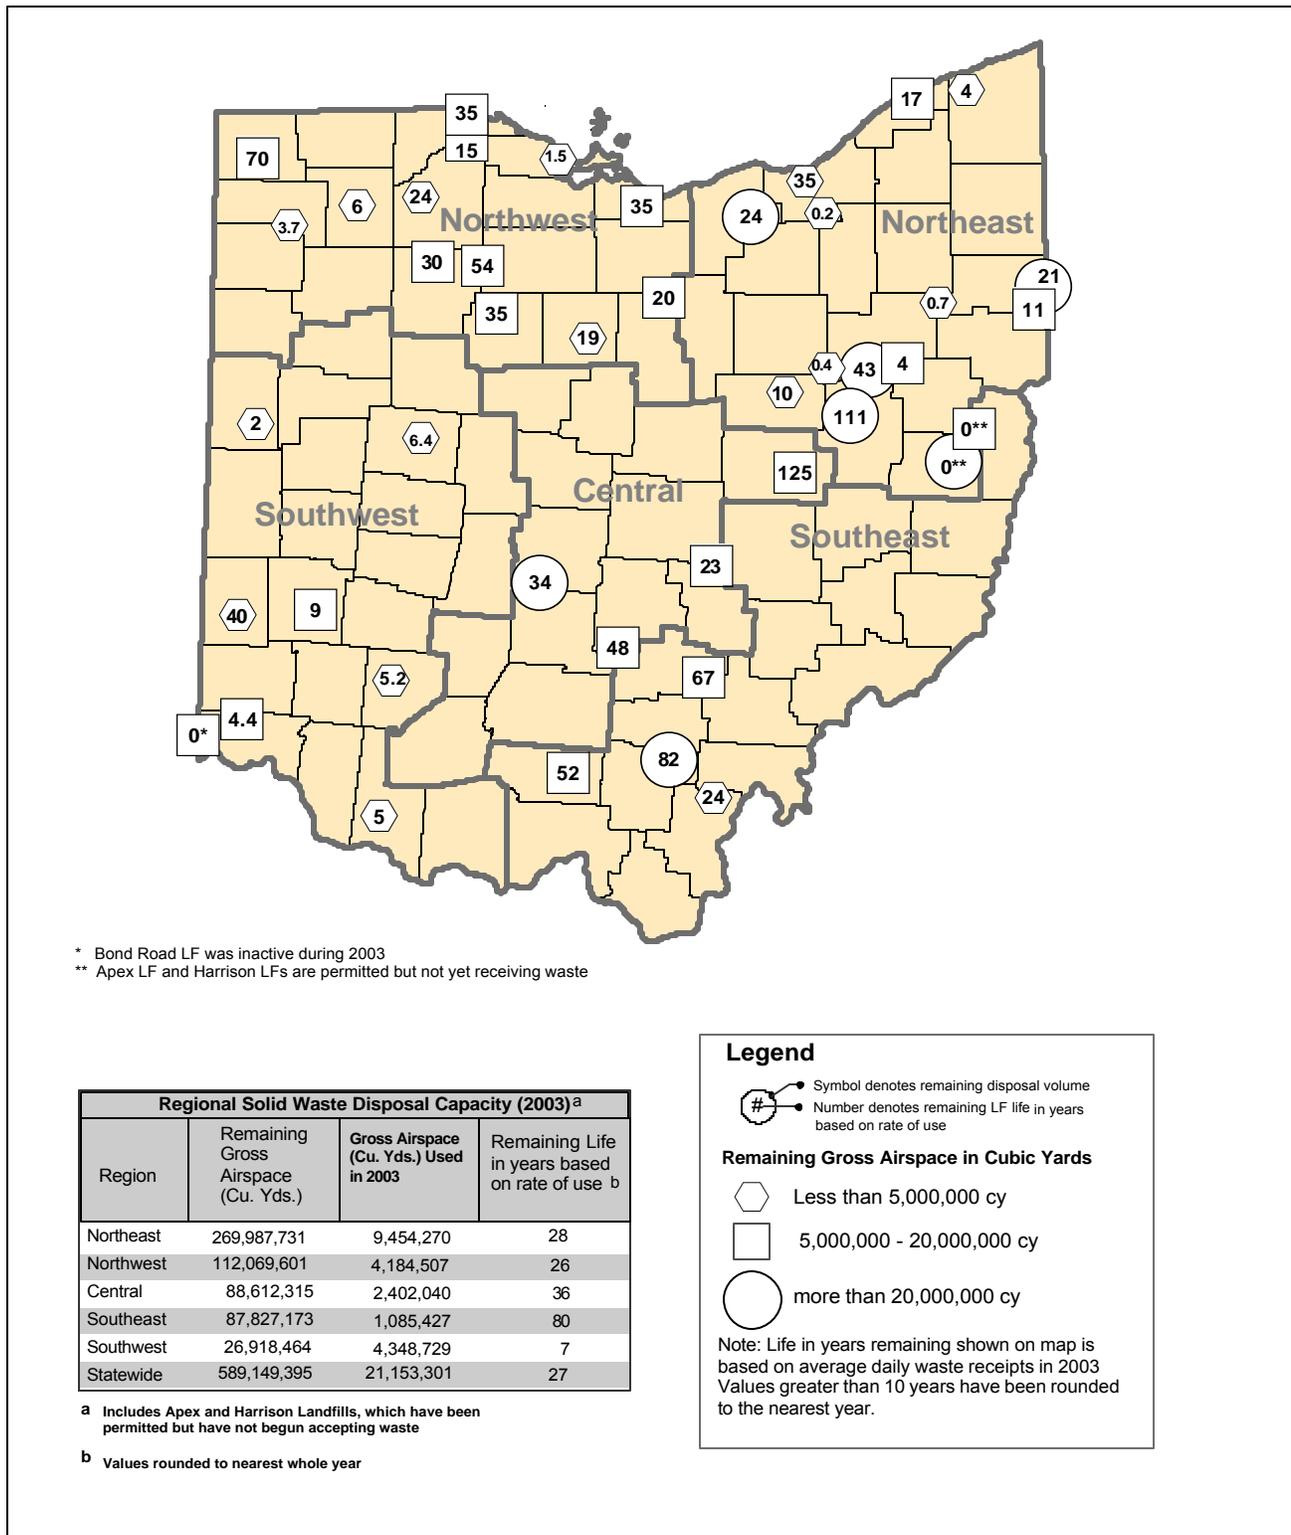

Figure 11. Landfill Life Expectancy and remaining solid waste disposal capacity in Ohio in 2003.

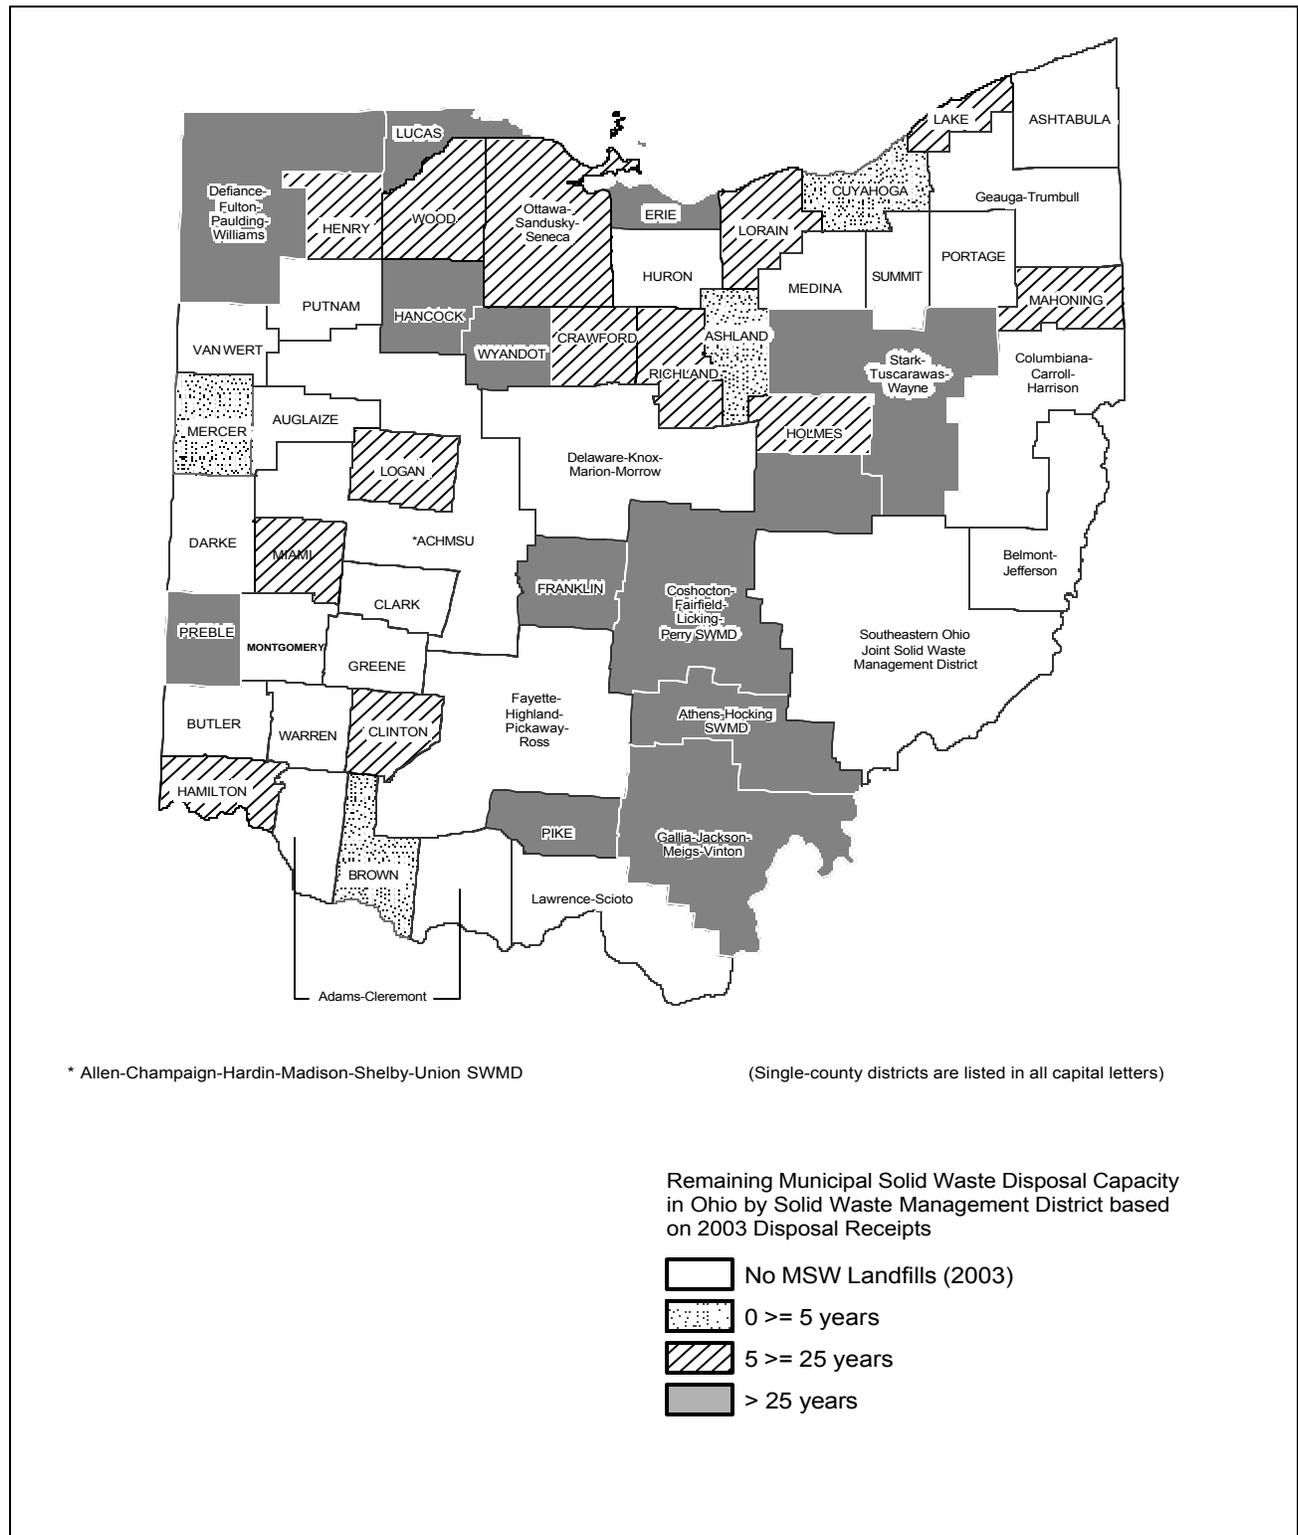

Figure 12. Publicly-Available Ohio Landfill Capacity by Solid Waste Management District

the facility. In addition, landfill operators also report remaining capacity as the number of years it would take to exhaust the existing airspace at the facility's current rate of waste placement, or at a rate expected by the operator.

The years of remaining landfill capacity are estimated in order to indicate any potential capacity shortfalls. Because of the length of time that may be associated with permitting, siting and constructing a new landfill, an area that has less than five years remaining disposal capacity has been defined by Ohio EPA as an area facing a potentially serious capacity shortfall. Currently, approval of an application for a permit-to-install for a new landfill facility, including Agency review and any necessary revisions to the application, will take a minimum of several years. The amount of time depends upon a variety of factors including the quality of the submittals by the applicant, and timely submittals of any additional information by the applicant. However, receiving a permit does not necessarily represent additional capacity; the facility must then be financed and constructed. Also, the Agency offers no guarantees that an application for a permit-to-install will be approved. An application could be denied based on unresolved siting, design, or background check issues.

Table 2 shows the remaining volume and the remaining years of capacity at all publicly-available municipal solid waste landfills based on several scenarios for the rate of airspace use. In all cases, gross airspace calculations include expansions approved at existing facilities during 2003. The figure also includes airspace from any new facilities which began operating by December 31, 2003. The remaining airspace estimate for all publicly-available landfills used in Table 2 also includes the volume for new facilities that have received a permit-to-install but have not been constructed or are not yet operating. Two such facilities which have been excluded are Apex Sanitary Landfill in Jefferson County and Harrison County Landfill in Harrison County. In addition, the gross airspace figure does not include captive landfill facilities.

Case 1 is based on reported information from publicly-available municipal solid waste landfills. The operators reported having 589,149,395 cubic yards of permitted airspace available for the placement of wastes at the end of 2003. The operators also reported using 23,477,051 cubic yards of airspace to dispose of the 15,914,241 tons of waste accepted during 2003. This remaining airspace would last approximately 27.8 years, assuming that no new airspace is added and the use of airspace remains constant at 21.2 million cubic yards per year.

The remaining years of capacity at publicly-available landfills can be affected by factors other than the volume added through new or expanded facilities. For example, the amount of airspace used to dispose of a given quantity of waste can be decreased by operating practices that reduce the amount of cover materials used, or that increase the compaction of the waste placed. Landfill operators are required by health and safety regulations to cover all of the waste placed on a working face once the daily operations cease. Operators commonly use soil as a daily cover material. However, many facilities now use an approved alternative daily cover material. Alternative cover materials such as textiles or foams often consume less landfill volume than soil.

The potential impact of increasing compaction and reducing the amount of cover materials used is illustrated in Case 2 of Table 2. In this scenario, the statewide ratio of volume used to weight of waste accepted is decreased from 1.33 cubic yards per ton, (as calculated from 2003 operator's reports) to 1.1 cubic yards per ton. The lower ratio results in an increase to 33.6 years of remaining capacity, assuming that the level of waste receipts remain constant.

Another key factor affecting the years of remaining capacity is the amount of waste accepted for disposal. Decreases in the amounts of waste requiring disposal as a result of reduction and recycling efforts, or a decline in the importation of out-of-state waste, would increase the years of remaining capacity. Conversely, increases in the amount of in-state waste to be landfilled, or imports of out-of-state waste, would decrease the years of remaining capacity.

The potential impact of changing levels of waste receipts is shown in Cases 3 and 4 in Table 2. In Case 3, it is assumed that increased reduction and recycling efforts produce a 15 percent decline from current landfill disposal receipts of 15.9 million tons. This results in a disposal of 13.5 million tons of waste per year, or the use of 17.9 million cubic yards per year at the ratio of 1.33 cubic yards per ton. At this rate of use it would take 32.9 years to exhaust the remaining airspace.

The Case 4 scenario assumes that waste receipts increase to 18 million tons per year (29.0 million cubic yards per year), which is approximately the amount of waste accepted by non-captive landfills in 1989. At a disposal rate of 18 million tons per year, it would take 24.6 years to exhaust the remaining airspace.

Table 13 shows the remaining capacity in gross airspace, tons available for waste placement, years remaining, average daily waste receipts in 2003, and AMDWR (Authorized Maximum Daily Waste Receipt) for each landfill in Ohio. The remaining capacity at the publicly-available solid waste landfills with the highest waste receipts during 2003 are shown in Table 3. Note: the statewide total at the end of Table 13 includes captives as well as municipal solid waste landfills and therefore does not match the statewide total shown in Table 2.

### **Regional Disposal Capacity**

For several years, the availability of disposal space has been shifting from small local landfills to larger regional landfills. This shift is indicated by the increasing use of transfer facilities and the fact that the number of operating landfills has decreased while remaining airspace has increased (See Figure 10). For example, in December of 1990, there were 76 municipal solid waste landfills in Ohio reporting a total remaining airspace of approximately 176 million cubic yards. By the end of 2003 there were only 44<sup>1</sup> municipal solid waste landfills, but they reported having 589.1 million cubic yards of remaining airspace. In addition, there were only 10 solid waste management districts without a landfill in 1990, whereas by the end of 2003, there were 23. These changes are in large part a results of the technological upgrades to the siting/design requirements. These requirements were promulgated in Ohio EPA's 1990 rules enacted as a result of the passage of House Bill 592 in 1988. Ohio's landfill regulations were updated again in 1994 to remain consistent with federal regulations.

Due to this trend, available landfill space within a SWMD is often not as important as access to a regional solid waste landfill. In 1994, the five landfills in the state with the highest waste receipts accounted for 64 percent of the reported remaining capacity in Ohio. Between 1994 and 2003, this percentage dropped considerably due to capacity increases at facilities that are utilized to a much lesser extent (See Table 3). By 2003, the five landfills with the highest waste receipts accounted for 36 percent of total waste receipts but represented only 28 percent (up from 17 percent in 2001) of total landfill capacity in Ohio.

In order to examine remaining landfill capacity on a regional basis, solid waste management districts were combined into five regions. The remaining capacity estimate for each region and SWMD is shown in Figure 11 and 12. The two regions with the most years of remaining capacity is the central and southeast region each with more than 75 years remaining capacity. The region with the least is the southwest region with just under seven years remaining. It is interesting to note that not long ago (1995) the central region had the lowest remaining capacity at 3.1 years.

Remaining life in years is calculated by dividing the total remaining airspace at the end of 2003 in cubic yards by the amount of cubic yards used in 2003. Therefore, the remaining life as shown in 2003 assumes waste receipts remain constant in future years. Obviously if waste generation and disposal increases, or recycling decreases, the years of remaining life will go down.

### **Potential New Capacity**

The estimates presented for remaining airspace and years of capacity (Table 2) include capacity at facilities that have received permits-to-install but have never been constructed. For example, as of December 31, 2003, there were two permitted but unconstructed facilities located in Harrison (Harrison County Sanitary Landfill) and Jefferson (Apex Sanitary Landfill) counties. Combined, these two facilities add approximately 76 million cubic yards to the statewide total. This adds approximately 3.6 years of landfill capacity to the statewide total, based on the current rate of airspace use (21.2 million cubic yards per year). However, these facilities may never be built due to the highly competitive nature of the waste disposal business, financing difficulties, or other factors. In addition to Apex and Harrison landfills, more than 215,000,000 cubic yards of capacity were proposed but unapproved at the end of 2003, which equals an additional 10 years of statewide capacity based on current rates of use.

**Remaining Capacity at Captive, Industrial Landfills**

Seventeen captive industrial landfills accepted 4.9 million tons (down from 6.3 million tons in 1999) of waste during 2003, and reported having approximately 83.2 million cubic yards of remaining airspace (this figure is down from 130 million cubic yards at the end of 1999 due to the closure of Champion International (Butler County) and the transfer of four captive landfills to the Ohio Department of Natural Resources (These four captives primarily disposed of by-products from mining operations and included; 1. Martin Marietta (Sandusky), 2. Lafarge Lime (Sandusky), 3. Millersville Lime (Sandusky), and 4. National Lime & Stone (Wyandot)). Four captive facilities that disposed of waste during 2003 reported having five years or less remaining. These four facilities disposed of 991,906 tons in 2003.

Captive landfill facilities may only accept waste generated by the company or industry that owns or operates the landfill. A captive facility may be permitted as a municipal solid waste, industrial or residual landfill. Industrial and residual landfills are limited to accepting only the specific waste streams that are identified in their permit. The wastes disposed in captive facilities are not included in the calculations of statewide, regional or SWMD estimates of remaining years of disposal capacity. However, when a captive facility closes, the waste stream it managed may be disposed at a publicly-available facility. Therefore, some of the waste currently managed at captive facilities is a potential source of additional waste for publicly-available landfills.

**Solid Waste Flows: Source and Destination****In-State Wastes**

Since 1991 the trend in disposal between out-of-district waste disposed (including waste disposed out-of-state) and in-district waste disposed has remained relatively flat. The majority of solid waste generated in Ohio continues to be disposed in-district as shown in Figure 13, ranging from a high of 66 percent in 1996 to a low of 58 percent in 2003. The disposal estimates are determined by taking total solid waste disposed in Ohio, subtracting out-of-state imports, and adding in solid waste exported out-of-state. Thus, the trend in disposal for the state since 1991 is toward out-of-district disposal. This trend toward more out-of-district disposal should not be surprising, given the continuing decrease in the number of landfills in Ohio. Detailed waste flow data showing

County	Number of Facilities	Tons of Out-of-State Waste Received

<b>Statewide Total</b>	<b>31</b>	<b>2,560,975</b>

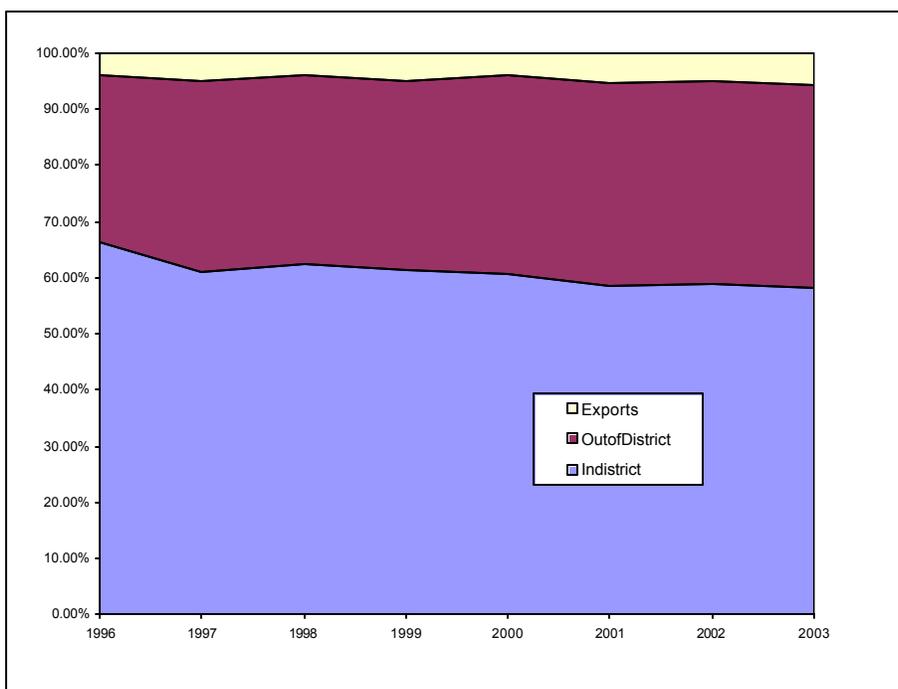

the source and destination of Ohio-generated waste, which was disposed in Ohio during 2003, can be found in Table 14.

Accurately tracking waste flows is often complicated by delivery of waste to an out-of-district transfer facility, which then sends its waste to an out-of-district landfill. By comparing reports from transfer facilities to landfill reports, and based upon information from SWMDs, it is clear that the origin or source of waste is improperly characterized in many situations, particularly when the waste is sent through a transfer station.

#### Out-of-State Wastes

Like wastes generated in Ohio, accurately tracking out-of-state wastes flows is often complicated by delivery of waste to a transfer facility, which then sends the waste to a landfill. When the waste hauler arrives at the landfill and is asked the origin of the wastes, the answer given is often the county in which the transfer station is located rather than the actual state from which the waste was imported. Unlike in-state transfers of waste in which the origin of wastes can usually be determined, it is difficult to ascertain the origin of out-of-state wastes that pass through a transfer station and are disposed in an Ohio landfill. As a result, the out-of-state wastes data presented below likely contains some inaccuracies; nonetheless, this is the best data available.

Solid waste from out-of-state sources became a concern during 1987 when receipts at Ohio landfills increased by more than 66 percent from the previous year. Out-of-state receipts totaled approximately 1 million tons or 7 percent of the total at 30 facilities in 1987. In 1988, Ohio landfills disposed over 17,670,000 tons of solid waste, including 2.8 million tons of out-of-state wastes, or 17 percent of the total. A total of 32 solid waste facilities accepted out-of-state waste in 1988, with the majority of out-of-state wastes being disposed in landfills in northeastern Ohio. During 1989, out-of-state waste receipts totaled approximately 3.7 million tons or 20 percent of the total. Twenty-nine solid waste landfills accepted out-of-state waste in 1989. The greatest volume of out-of-state waste was accepted at landfills in Northeast Ohio. The continuing trend of increasing out-of-state wastes ended in 1990 when Ohio facilities received 1.9 million tons at 22 landfills. Between 1989 and 1996, the amount of waste originating from outside Ohio that was disposed in Ohio

**Figure 13.** Percent of Ohio-Generated Waste Disposed In-District, Out-District, or Out-of-State

1. New York	887,297 tons
2. Pennsylvania	467,042 tons

4. Connecticut	234,311 tons
5. Indiana	157,512 tons
6. Massachusetts	120,450 tons
7. West Virginia	113,844 tons
8. Kentucky	46,307 tons
9. Michigan	45,561 tons
10. Rhode Island	17,301 tons
11. New Hampshire	14,521 tons
12. 16 other states	5,837 tons
<b>Total</b>	<b>2,541,074 tons</b>

**Table 4.1.** Amount of Solid Waste Imported into Ohio from Other States in 2003

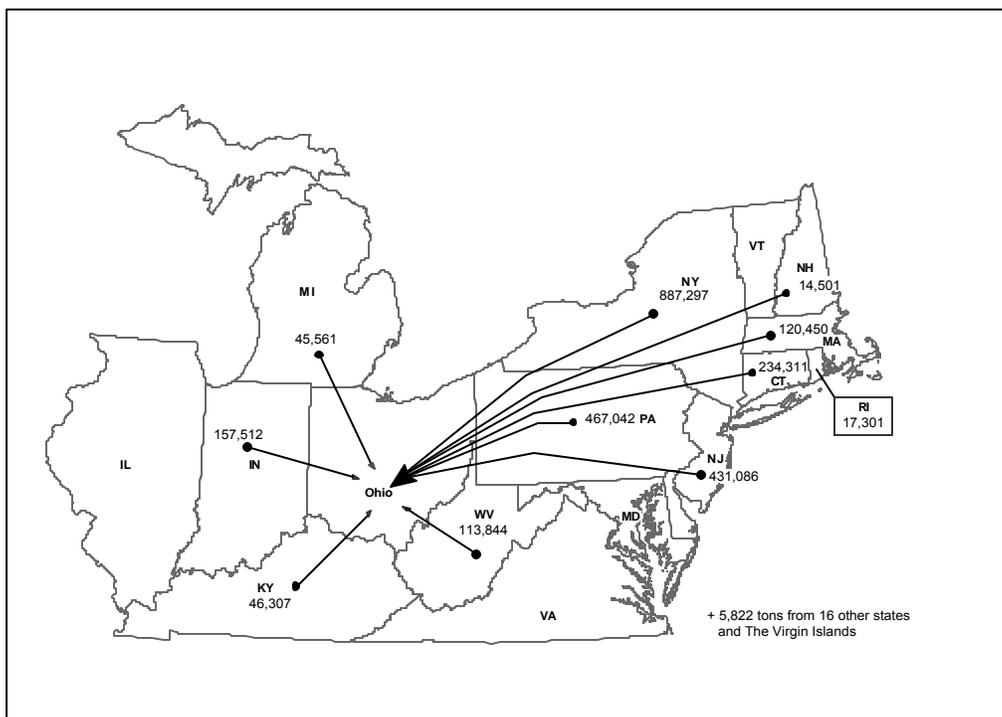

Figure 14. Ohio Solid Waste Imports from States Disposing More than 10,000 tons in 2003.

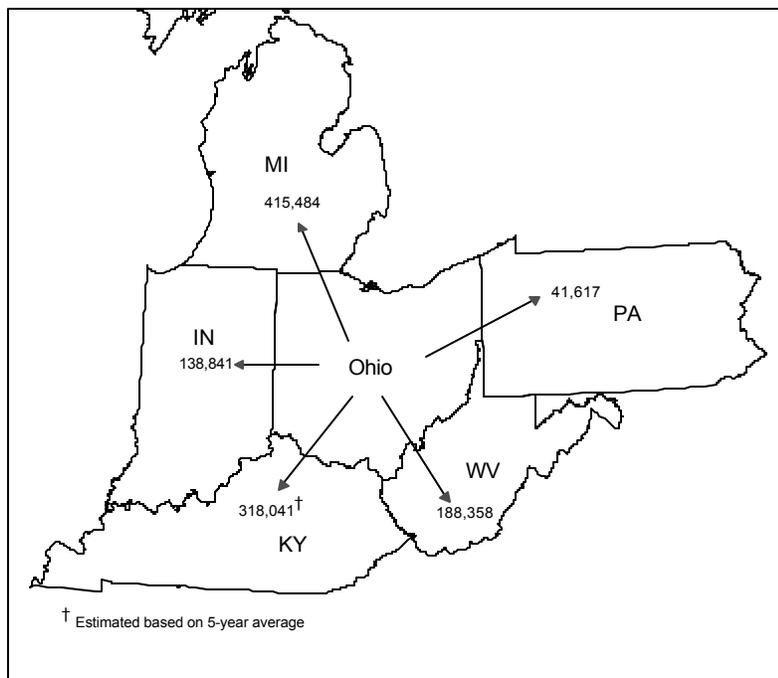

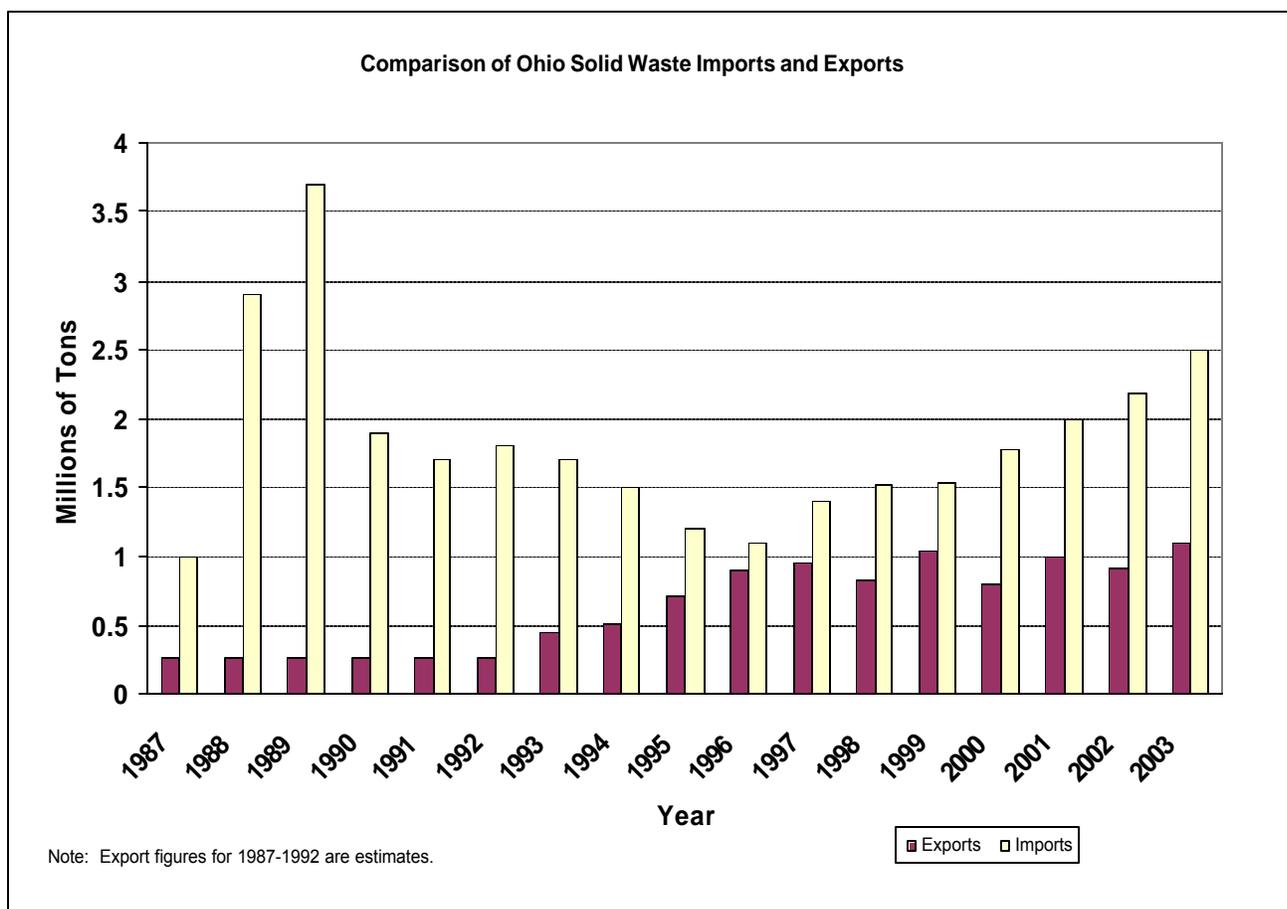

Figure 15. Ohio Solid Waste Exports During 2003.

landfills steadily declined. This seven year trend was reversed in 1997 when the amount of wastes generated out-of-state and disposed in Ohio increased by 300,000 tons to 1.4 million tons. The amount of out-of-state waste disposed in Ohio has continued to increase in 1998 with 1.52 million tons and also in 1999 with 1.53 million tons. The tonnage of waste imported to Ohio includes tonnages reported at landfills, transfer facilities and incinerators. Table 4.1 shows the states that sent solid waste to Ohio for disposal in 2003.

The 2.54 million tons of solid wastes Ohio received from out-of-state in 2003 represented 12 percent (up from 7 percent in 1999) of all solid wastes disposed in Ohio. Thirty-two percent of this was local waste from our five neighboring states (West Virginia, Kentucky, Indiana, Michigan, and Pennsylvania). Sixty-one percent was long-haul waste from New York

**Figure 16. Comparison of Ohio Solid Waste Imports and Exports**

(887,297 tons), New Jersey (431,086) and Connecticut (234,311). The remaining six percent was long-haul waste from 19 other states including 18 tons from Texas, 37 tons from Washington, and 72 tons from Florida.

A total of 31 facilities (including 27 publicly-available landfills, one incinerator, two scrap tire monofills and Envirosafe), in 19 solid waste management districts, reported disposing the 2.54 million tons of out-of-state solid wastes received in Ohio. Sixty-two percent, or 1,576,791 tons, of the out-of-state waste was disposed in two landfills in Ohio in 2003. These were: BFI Carbon-Limestone Landfill in Mahoning County, which disposed of 1,021,004 tons, and AWS American Landfill in Stark County, which disposed 555,785 tons.

Table 4 on page 20 shows twenty-one solid waste management districts receiving this out-of-state waste (either by landfill, incinerator, transfer station or scrap tire monofill), the number of facilities that received out-of-state waste, and the amount of waste disposed from out-of-state sources. *Npte: 19,904 tons of out-of state was were received at transfer stations. To avoid double counting this amount is not included in the 2,541,074 tons disposed in Ohio.*

#### **Why is out-of-state waste a concern to Ohio?**

- It is difficult or impossible for state and local inspectors to verify that hazardous or untreated infectious waste has not been included in solid waste shipments that are shredded or heavily compacted before being shipped long distances.
- Citizen opposition to landfills that are perceived as servicing primarily out-of-state waste hinders the siting of facilities needed to provide disposal capacity for Ohio's waste.
- Citizens are reluctant to reduce or recycle waste when they believe their efforts will only serve to make room for trash from other states.
- In 2003 Ohio's average tipping fee was \$30.46. This amount is twenty dollars below the average tipping fee in the northeast region of the U.S. and three dollars below the tipping fee in the southern and midwest regions (Solid Waste

Digest, Vol 13 Number 12, Chartwell Information, EBI Inc., <http://www.wasteinfo.com>). With low tipping fees and an abundance of permitted landfill airspace, the potential exists for even larger amounts of out-of-state waste to flow into Ohio in the next several years.

Table 4.1 on page 21 ranks the sources of out-of-state waste imported into Ohio in 2003 (as reported by landfills, transfer stations and incinerators).

Some landfill owners, particularly government entities, have chosen to protect available remaining disposal capacity by imposing service area restrictions. In some instances, these restrictions are established in host community agreements between the landfill and the local political jurisdiction. Many counties that own landfills have chosen not to accept any out-of-state and/or out-of-county waste or have imposed high surcharges on waste received from outside the county. However, several counties that have previously followed this practice have more recently solicited out-of-county waste for disposal in an effort to reduce the landfill operation's costs per ton, and therefore keep the landfill facility financially viable.

House Bill 592 (effective in 1988), gave SWMDs the authority to limit or prohibit the receipt of out-of-state and out-of-district wastes at any facility within their jurisdiction in order to meet their ten-year planning requirements. The ability of government entities to impose these type of restrictions on landfill service areas, however, has been successfully challenged in the federal courts, and therefore as a practical matter SWMDs in Ohio no longer have the ability to impose these type of controls.

#### **Ohio Solid Waste Exports**

Prior to 1996, not all of Ohio's neighboring states had reporting requirements for landfills in their state. Since data on exports were not complete, Ohio EPA has reported exported tonnages as gross estimates for the years before 1996. Now that all states that are contiguous with Ohio require landfills to report disposal data to them, Ohio EPA believes the 2003 out-of-state data are as accurate as possible. In addition, a few solid waste management districts attempt to track their in-district waste which is disposed out-of-state. These districts report this total to Ohio EPA using their Annual District Reports. Thus the export information provided below was compiled from out-of-state data and district data.

Ohio EPA estimated total solid waste exports from Ohio to be approximately 270,000 tons for each of the years between 1987 and 1993. However, in 1993, exports increased to approximately 452,000 tons. Solid waste exports from Ohio were estimated at 509,460 tons for 1994. In 1995, 1996 and 1997, the trend of increasing waste exports continued with an estimated 707,734 tons, 902,388 tons and 945,188 tons exported out-of-state, respectively.

Based upon information obtained from adjacent state regulatory agencies, in 2003, solid waste exports from Ohio increased to 1,102,342 tons. See Figure 14 for the amounts of solid waste Ohio exported to each of its neighboring states. A comparison of Ohio's exports and imports since 1987 can be found in Figure 15. Table 4.2 on page 24 shows the exports that can be identified by SWMD of export.

In 2003, Indiana, Michigan, and Pennsylvania did not identify the SWMD of origin in their reports. And at the time of printing, data for Kentucky was unavailable so the total amount reported for Kentucky is based on a five year average. Data presented above for all states is based on information provided by SWMDs that have contracts or other special agreements with out-of-state waste facilities or haulers and by waste destinations reported by Ohio transfer facilities. Tonnages that were reported received but not identified by SWMD of origin are: Michigan (415,484 tons), Pennsylvania (341,618 tons), West Virginia (188,358 tons) and Kentucky (318,041 tons estimated).

**Explanation of Comprehensive Solid Waste Facility Tables**

Most of the tables presented on the following pages are organized by solid waste management district (SWMD).

House Bill 592, which became law on June 24, 1988, required Ohio counties to form single or joint county solid waste management districts. During 2003, there were 37 single and 15 joint SWMDs.

**Description of Each Table**

Table 5 identifies all municipal landfill facilities in Ohio as shown in Figure 17.

Table 6 identifies all transfer facilities in Ohio as shown in Figure 18.

Table 7 shows the amount of waste accepted for each landfill in Ohio. The amount of waste accepted is given according to its generation source: in- district, out-of-district, and out-of-state.

Table 7.1 shows the amount of waste accepted for each landfill in Ohio. The amount of waste accepted is given according to its solid waste type: asbestos, general, industrial, exempt, and other.

Table 8 shows the total amount of waste disposed by each landfill in Ohio for 2001, 2002 and 2003.

Table 9 shows information for solid waste incinerators in Ohio. The amount of waste received and tons of incinerator ash sent for disposal are presented.

Table 10 shows the licensed solid waste transfer facilities in Ohio. The amount of waste received is shown by generation source: in-district, out-of-district, out-of-state.

Table 11 shows solid waste transfer facilities reporting recycling activities in 2003.

Table 12 shows the types of waste received by each landfill in the State by solid waste management district. Landfill owner/operators are required to record the type of waste received as haulers deliver it to the site.

Table 13 shows the remaining capacity in volume (cubic yards), tons for waste placement, and years of life remaining as reported by facility operators. Measurement of remaining capacity is typically undertaken after the end of the calendar year; in January, February, or March. This table also shows the average daily waste receipts and the authorized maximum daily waste receipt limit for each facility.

Table 14 shows the waste flows during 2003 organized by the sending solid waste management district.

**Definition of Data**

Data was tabulated by Ohio EPA for 2003 operations at each facility as reported by the owner/operator. Both operating and inactive licensed facilities are included in the evaluation of existing capacity. (Note: On occasion a non-licensed facility is included in the report under the following circumstances. When Ohio EPA issues an order to close a facility or otherwise proposes denial of an operating license, the facility may appeal the proposed action. While the action is under appeal, the facility may continue to operate. Accordingly, while not licensed, the facility would be actively operating, and the projected capacities for these landfills may be included in the appropriate calculations until the appeal process is complete.)

A survey form completed by owners/operators of solid waste facilities provides updated waste facility data to the Ohio EPA on an annual basis. Licensed solid waste facilities are required to prepare and submit to Ohio EPA an annual summary of operations [Ohio Administrative Code 3745-27-19(M)]. When processing facility information for amount of waste received, a conversion factor of one ton equals three cubic yards was used when the total waste disposed was

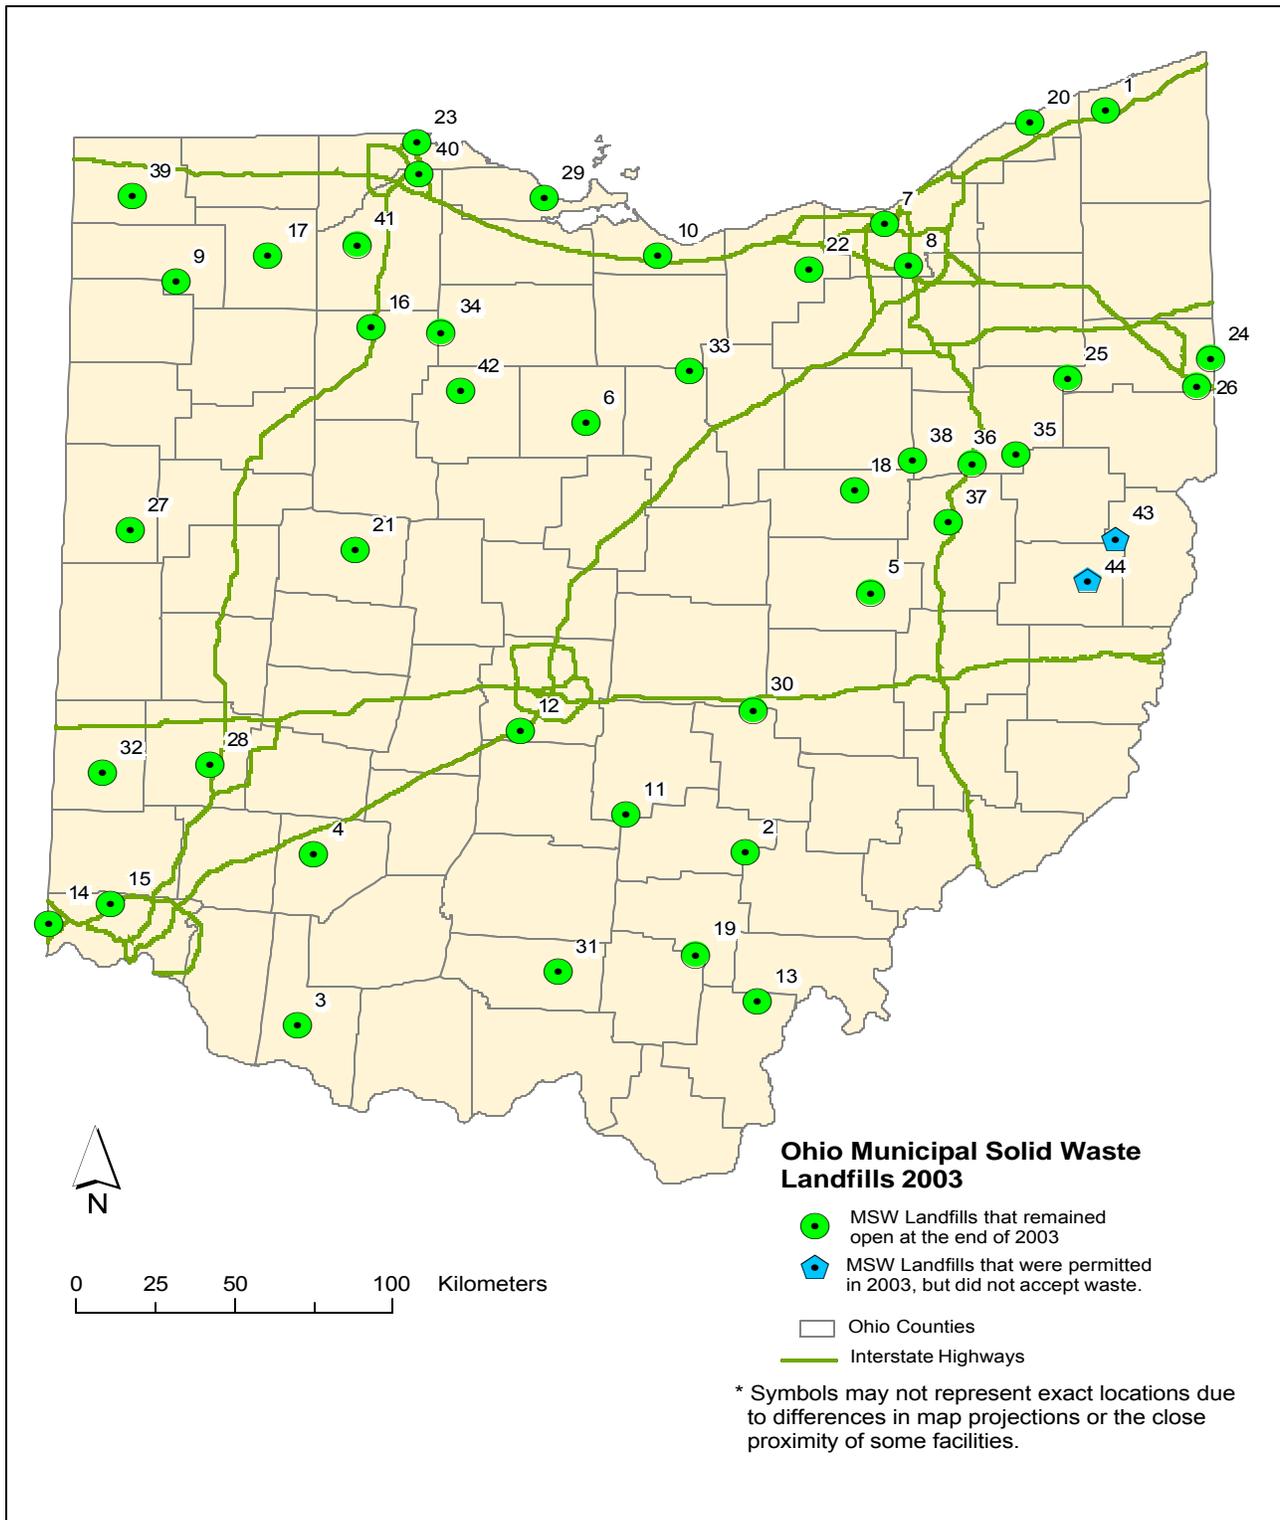

reported in cubic yards except where the operators of the landfills reported other conversion factors. “Annual disposal volume” and “remaining capacity in years” are reported by the landfill owners and operators each year in a separate report in accordance with Ohio Administrative Code 3745-27-19(M).

The “remaining capacity,” as reported by each landfill, reflects only the unfilled volume in cubic yards, available for disposal in the permitted area of the landfill. This yardage does not reflect the potential for additional volume which may become available through a currently un-permitted vertical or lateral expansion of the landfill. “Remaining capacity” may increase if an expansion is approved. Associated with the “remaining capacity” is the expected life of the landfill, in years, which is determined by the rate of filling. If an increase in the authorized maximum daily waste receipt limit is approved and utilized, with no change in the landfill capacity, the expected life of the landfill will decrease. ⊖

**Endnotes**

- <sup>1</sup>. Captive industrial facilities are not open to the public and accept only waste generated by the owner of the facility, who also owns the industrial facility where the waste is generated.
- <sup>2</sup>. An industrial solid waste landfill “...exclusively disposes one or any combination of industrial solid wastes...and may dispose of nontoxic fly ash, nontoxic bottom ash, nontoxic spent foundry sand, slag, or construction and demolition debris materials, and which has not disposed of, during its operating life, significant quantities of municipal solid waste...” (Ohio Administrative Code 3745-29-01(B))
- <sup>3</sup>. Residual solid wastes are industrial solid waste generated from one of seven industrial operations: fuel burning operations which burn primarily coal, foundry operations, pulp and papermaking operations, steelmaking operations, gypsum processing plant operations, lime processing operations, and portland cement operations. A residual waste landfill “...is a sanitary landfill facility which exclusively disposes of one or any combination of residual solid wastes...and may dispose of nontoxic fly ash, nontoxic bottom ash, and nontoxic foundry sand. Residual waste landfill facilities include four classifications: class I, class II, class III, and class IV...” (Ohio Administrative Code 3745-30-01(C)).
- <sup>4</sup> Including two facilities that are permitted but not operating as they are unconstructed; Apex Landfill in Jefferson County and Harrison Landfill in Harrison County.
