Sandusky-Clyde Energy Solutions Permit Issued by Ohio EPA

Ohio EPA has issued a final air pollution permit to Sandusky-Clyde Energy Solutions for construction of a new natural gas-fired electric power plant in Clyde.

The company plans to install seven natural gas-fired engines and electrical generators in an industrial park at 300 Premier Drive. Electricity would be produced for sale on the power grid.

Except for the location, this permit is identical to a permit issued to the company for the project in February 2011. The change in location required the company to get a new air pollution permit. This was explained August 4, 2011, in Clyde during an Ohio EPA public hearing.

The permit limits the facility's annual air emissions to 11.62 tons of carbon monoxide and 2.73 tons of nitrogen oxides. Emissions also would include up to 0.28 tons per year of volatile organic compounds. The maximum allowable emission levels in the permit are designed to meet federal air quality standards to protect human health and the environment.

A copy of the [final permit](#) and Ohio EPA response to public comments received during the public comment period and at the public meeting is available online.
