1. Design flows that are greater than 1.0 million gallons per day (MGD) classify a facility as a major discharger. Design flows of “not applicable (N/A)” indicate that the discharge is storm water only, so there is no design flow.

2. The first letter indicates the number of permit cycles that have occurred for the facility, where “A” represent the first and “B” represents the second and so on. Permit cycles typically occur over five year time periods.

3. There were three discharges from this facility from 2004-2007, so the average flow during that period was effectively 0 MGD.
